

AnyTone 5555N Adjustment and Modification

W8 "AMANL" - AMC

W14 "SSBPWR" - ALC

W4 "PWRL" - AM LOW Power

W11 "AMMOD" - Internal Mic Gain

*Adjust **W8** AND **W11** to control your forward drive on AM. **DO NOT** adjust so high you become a splatmaster!

Note: These SMT-sized potentiometers do not have "stops" at the ends of their effective range. They will simply keep turning in circles... If you adjust out of range, the reading will return to "low". Back the adjustment back 1/8 turn when that happens and you'll likely find the sweet spot.

"**Export Mod**" -- carefully melt a solder bridge over **OP1**.

Echo: There are no external adjustments for echo other than on/off. Set the echo time and vol using **W16** and **W15** to your liking. Then use the front menu adjustment to turn the echo on or off.
