

SERVICE MANUAL

VHF MARINE TRANSCEIVER

IC-M10A

IC-M10E

INTRODUCTION

This service manual describes the latest information for the **IC-M10A** and **IC-M10E** VHF MARINE TRANSCEIVER at the time of publication.

MODEL	VERSION NUMBER	VERSION
IC-M10A	#01, #02	USA
IC-M10E	#03	EUR
	#04	UK
	#09	ITA
	#10, #11	FRA

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that used more than 15 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110003330	S. IC	TA31136F(EL)	IC-M10	MAIN UNIT	5 pieces
8810005710	Screw	PH B0 M2×6 ZK	IC-M10	Rear Panel	10 pieces

Address are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

- Frequency range : Transmit 156.0-157.5 MHz
Receive 156.0-163.0 MHz
- Mode : FM (16K0G3E)
- Channel spacing : 25 kHz
- Power supply requirement : Icom battery packs BP-157A, BP-160, BP-174 or 6 dry cell batteries with BP-130A
- Current drain : Receive Power saved 19 mA
Max. audio 300 mA
Transmit High 1.8 A (0.9 A for France version)
Low 0.9 A (0.6 A for France version)
- Antenna impedance : 50 Ω (unbalanced)
- Usable temperature range : -20°C to $+60^{\circ}\text{C}$ (-4°F to $+140^{\circ}\text{F}$)
- Frequency stability : $\pm 0.0005\%$ (-20°C to $+60^{\circ}\text{C}$)
- Dimensions : with BP-130A/BP-160 60 (W) \times 127 (H) \times 40 (D) mm
2.4 (W) \times 5.0 (H) \times 1.6 (D) in
with BP-174 60 (W) \times 155 (H) \times 40 (D) mm
2.4 (W) \times 6.1 (H) \times 1.6 (D) in
(projections not included)
- Weight : with BP-130A 300 g; 10.6 oz (include 6 dry cells)
with BP-160 310 g; 10.9 oz
with BP-174 422 g; 14.9 oz

■ TRANSMITTER

- Output power (High/low) : 3 W/0.5 W (typical with BP-130A)
6 W/0.5 W (with BP-174)
1 W/0.25 W (France version)
- Modulation system : Variable reactance phase modulation
- Maximum frequency deviation : ± 5 kHz
- Spurious emissions : -65 dB ($0.25 \mu\text{W}^*$)
- Noise and hum : -40 dB
- Audio frequency response : -3 dB to $+1$ dB of $+6$ dB/octave with 300 Hz to 3000 Hz input
- Audio harmonic distortion : 10%

■ RECEIVER

- Receive system : Double conversion superheterodyne
- Sensitivity : $0.35 \mu\text{V}$ for 12 dB SINAD
- Intermediate frequencies : 1st 30.875 MHz
2nd 455 kHz
- Squelch threshold sensitivity : $0.3 \mu\text{V}$
- Adjacent channel selectivity : -60 dB
- Intermodulation rejection : -60 dB (-68 dB*)
- Spurious response rejection : -60 dB (-70 dB*)
- Audio output power : 500 mW at 10 % distortion with an 8 Ω load
- Noise and hum : -40 dB
- Audio frequency response : -3 dB to $+1$ dB of -6 dB/octave with 300 Hz to 3000 Hz modulation

*Values for European versions measured in accordance with ETS300 162.
All specifications are subject to change without notice or obligation.

* U.S.A. channel 15 is a receive-only channel.

SECTION 2 DISASSEMBLY INSTRUCTIONS

● REMOVING THE FRONT PANEL

1. Turn the power OFF, then remove the battery pack.
2. Remove 4 screws (A) and (B) from the rear and front panels.
3. Pull off the [CHANNEL] knob, then remove the exposed VR nut.

4. Carefully open the front panel from the bottom side.

● REMOVING THE MAIN UNIT AND REAR PANEL

1. Unplug the flexible cable.
2. Remove the release button.
3. Pull off the [OFF/VOL] knob, then remove the exposed VR nut.
4. Remove 4 screws (C) from the MAIN unit.
5. Lift the MAIN unit to remove. (Disconnect J2 on reverse side of the MAIN unit to remove).
6. Carefully open the rear panel from the chassis.

● REMOVING THE RF UNIT

1. Remove the jack seal and VR plate. (For France version, take the rear shield off before removing.)
2. Remove 5 screws (D) and (E).
3. Unsolder the point (F), then remove the RF unit.

SECTION 3 INSIDE VIEWS

• LOGIC UNIT

- Crystal oscillator for CPU clock (X1: MA-416)
- Data expander (IC2: X24C04S8-2.7)
- CPU (IC1: HD404818D03H)
- LED driver (Q1: 2SC2712)

• MAIN UNIT

- Installation space for the UT-98
- 2nd IF filter (F11: CFW455E)
- 2nd LO crystal (X1: CR-473)

• RF UNIT

- Power amplifier (Q19: 2SC1971)
- PLL IC (IC1: M64073GP)
- PLL reference oscillator (X1: CR-503)

- RF amplifier on reverse side (Q1: 2SK882)
- VCO circuit
- 1st IF mixer on reverse side (Q2: 3SK131)
- Crystal filter (F11: FL-199)

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (RF UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals enter the antenna connector and then pass through the low-pass filter (L1—L3, C1—C6). The filtered signals are passed through the $\lambda/4$ type antenna switching circuit (D1, D2, L4, C9) and are then applied to the RF amplifier circuit.

4-1-2 RF AND 1ST MIXER CIRCUITS (RF UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the antenna switching circuit are passed through the tunable bandpass filter (L5, D3) and amplified at the RF amplifier (Q1). The amplified signals are again passed through the tunable bandpass filter (D4, D5, L6, L7). The signals are then mixed at the 1st mixer (Q2) with a 1st LO signal coming from the PLL circuit to produce a 30.875 MHz 1st IF signal. The 1st IF signal is passed through a pair of crystal filters (F11) and is then applied to the IF amplifier (Q3).

4-1-3 2ND IF AND DEMODULATOR CIRCUITS (MAIN UNIT)

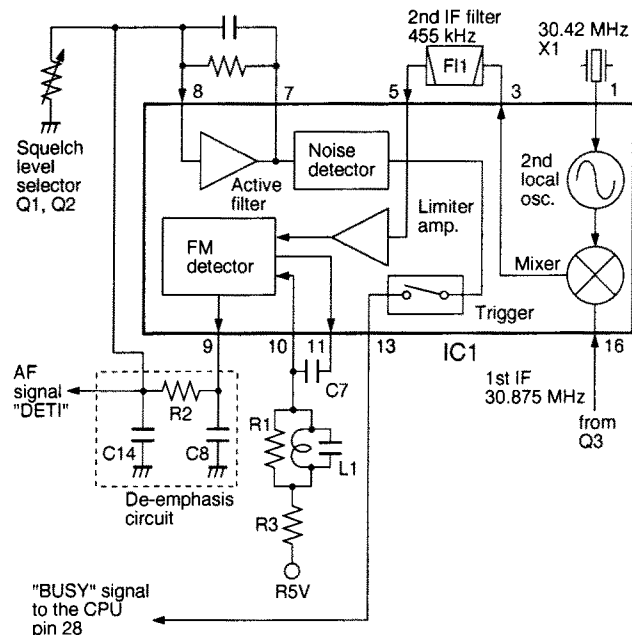

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double conversion superheterodyne system (which converts receive signal twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from the RF unit is applied to a 2nd mixer section of IC1 (pin 16). The signal is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, local oscillator, limiter amplifier, quadrature detector and active filter. The local oscillator section generates 30.42 MHz using X1.

The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through ceramic filter (F11) to remove unwanted heterodyned frequencies. It is then amplified at the limiter amplifier (IC1, pin 5) and applied to the quadrature detector (IC1, pins 10, 11) to demodulate the 2nd IF signal into AF signals. The AF signals (detected signals) are applied to the AF circuit.

• 2nd IF AND DEMODULATOR CIRCUITS

4-1-4 AF CIRCUIT (MAIN UNIT)

AF signals from IC1 are entered to the optional voice scrambler unit to demodulate the scrambled audio, or bypassed the unit via the analog switch (IC5, pins 1, 2).

The signals are passed through the de-emphasis circuit (R52, C43) and applied to the active high-pass filter (Q12). The filtered signals are passed through the AF mute switch (Q13) and the [VOL] control (RF unit). The mute switch (Q13) cuts the audio line when the squelch closes.

The passed signals (via "AFIN") are amplified at the AF power amplifier (IC5) to a level needed to drive the speaker.

For power conservation, the power supply circuit (Q9, Q10, D1) does not supply Vcc voltage to the AF power amplifier (IC5) when the squelch closes.

4-1-5 SQUELCH CIRCUIT (MAIN UNIT)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch.

A portion of the AF signals from the FM IF IC (IC1, pin 9) are applied to the active filter (IC1, pin 8) where noise components above 20 kHz are amplified and detected with internal noise detector. The squelch input level selector (Q1, Q2) is connected in parallel to the active filter input (pin 8) to control the input noise level.

The trigger circuit converts the detected signals to a HIGH or LOW signal and applies this to the CPU (LOGIC unit IC1, pin 27) as the "BUSY" signal. When the CPU receives LOW the CPU outputs the "RMUT" signal via the Data expander IC (MAIN unit IC4, pin 14) to cut the AF signals.

The "RMUT" signal switches the AF mute switch (Q13). At the same time, the "AFON" line becomes "HIGH" to deactivate the power supply circuit of the AF amplifier (Q9, Q10, D1). However, it activates while emitting beeps.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER (MAIN UNIT)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis characteristics from the microphone to a level needed for the modulation circuit.

The AF signals from the microphone are entered to the optional voice scrambler unit to scramble the audio, or bypassed the unit via analog switch (IC5, pins 5, 6).

The signals are amplified at the limiter amplifier (MAIN unit IC7b) which has a negative feedback circuit for +6 dB/octave pre-emphasis.

RF components are then filtered out at the splatter filter (IC7a) and applied to the RF unit as the "MOD" signal.

4-2-2 MODULATION CIRCUIT (RF UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The audio signals (MOD) change the reactance of D8 to modulate the oscillated signal at the transmitter VCO (Q11). The oscillated signal is amplified at the buffer amplifier (Q12, Q14), then applied to the drive amplifiers.

4-2-3 DRIVE/POWER AMPLIFIER CIRCUITS (RF UNIT)

The signal from the VCO circuit is passed through the transmit/receive switching circuit (D10) and amplified by the RF power amplifiers (Q16-Q19) to obtain 5 W of RF power (1 W for France version). The amplified signal is passed through the antenna switching circuit (D1), and low-pass filter (L1-L3, C1-C6) and is then applied to the antenna connector.

The bias current of the RF amplifiers (Q17, Q18) are controlled by the APC circuit to stabilize the output power.

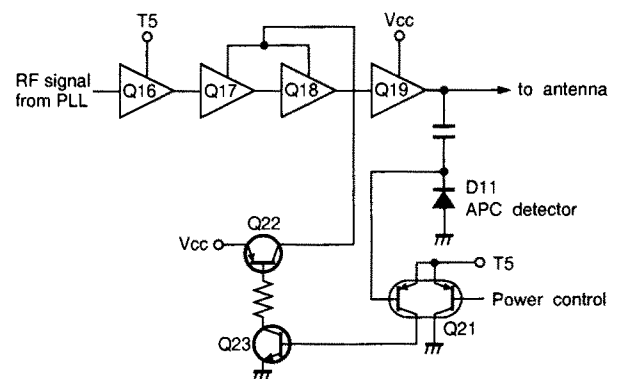

4-2-4 APC CIRCUIT (RF UNIT)

The APC circuit provides stable output power from the power amplifier (Q19) even when the input voltage or temperature changes; and, selects high or low output power.

The APC detector circuit (D11) detects the output power level. The detected voltage increases according to the output power level.

The detected voltage is applied to one of the differential amplifier inputs (Q21 pin 5) and a power setting voltage is applied to the other input (Q21). When the output power is increased, the detected voltage exceeds the APC output current (Q22 collector) via Q23 to decrease the output power.

● APC CIRCUIT

4-3 PLL CIRCUIT (RF UNIT)

A PLL circuit provides stable oscillation of the transmitter frequency and the receive frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

The IC-M10's PLL circuit contains a separate receiver VCO (Q10, D6) and transmitter VCO (Q11, D7). The oscillated signal is amplified at the buffer amplifier (Q12, Q13) and then applied to the PLL IC (IC1, pin 5).

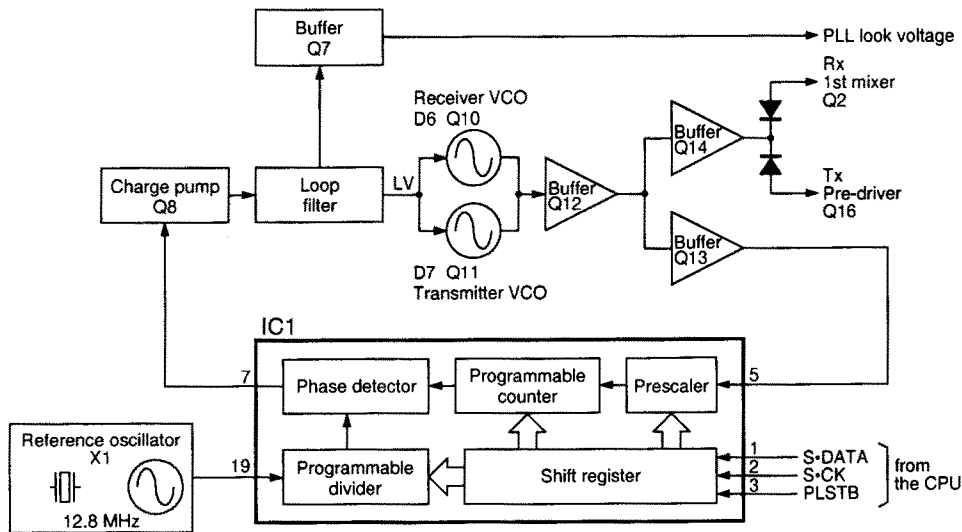

The PLL IC (IC1) contains a prescaler, programmable divider, and a phase detector, etc. The entered signal is divided at the prescaler and programmable counter sections by the N-data ratio from the CPU. The divided signals are detected on phase at the phase detector using the reference frequency.

If the oscillated signal drifts, the phase of its frequency changes from the reference frequency, causing a lock voltage change to compensate for the drift in the oscillated frequency.

One of VCO signals is amplified at the buffer amplifiers (Q12, Q14) and is then applied to the receive 1st mixer or transmit driver circuit.

The lock voltage is also used for the receiver tunable bandpass filters to match the filter's center frequency to the desired receive frequency. The lock voltage is amplified at the buffer amplifier (Q7) and then applied to the varactor diodes (D3, D4, D5).

● PLL CIRCUIT

4-4 POWER SUPPLY CIRCUITS

VOLTAGE LINES (MAIN UNIT)

LINE	DESCRIPTION
VCC	The same voltage as the battery voltage which is controlled by the power switch ([OFF/VOL] control).
+5	Common 5 V converted from the VCC line by the 5 V regulator circuit (Q7, Q8) using the reference regulator (IC2).
AFVCC	8 V for AF amplifier (IC5) controlled by "AFON" signal from IC4. The "AFVCC" regulator circuit consists of Q9, Q10 and D1.
T+5	5 V for transmitter circuit controlled by "TMUTE" signal from IC4 using the reference regulator (IC2). The "T+5" regulator circuit consists of Q5, Q6.
R+5	5 V for receiver circuit converted from the "+5" line circuit at Q6 on the RF unit. This voltage is controlled by "PSC" signal from IC4.

4-5 PORT ALLOCATIONS

4-5-1 EXPANDER IC (MAIN UNIT IC4)

PIN NO.	PORT NAME	DESCRIPTION
1	STB	Input port for a strobe signal from the CPU.
2	DATA	Input port for a data signal from the CPU.
3	CK	Input port for a clock signal from the CPU.
5	SC ON	Outputs a scrambler signal when an optional scrambler unit is in use.
6	PSC	Outputs a power save control signal to the R+5 regulator circuit.
7	SEND	Outputs a transmit/receive switching signal. "HIGH" when transmitting.
12	AF ON	Outputs an AF power amp control signal. "LOW" to activate the AF amp.
13	TMUTE	Outputs a transmit mute signal. "HIGH" to mute the T+5 V.
14	RMUTE	Outputs a receive mute signal. "HIGH" to mute the receive audio.

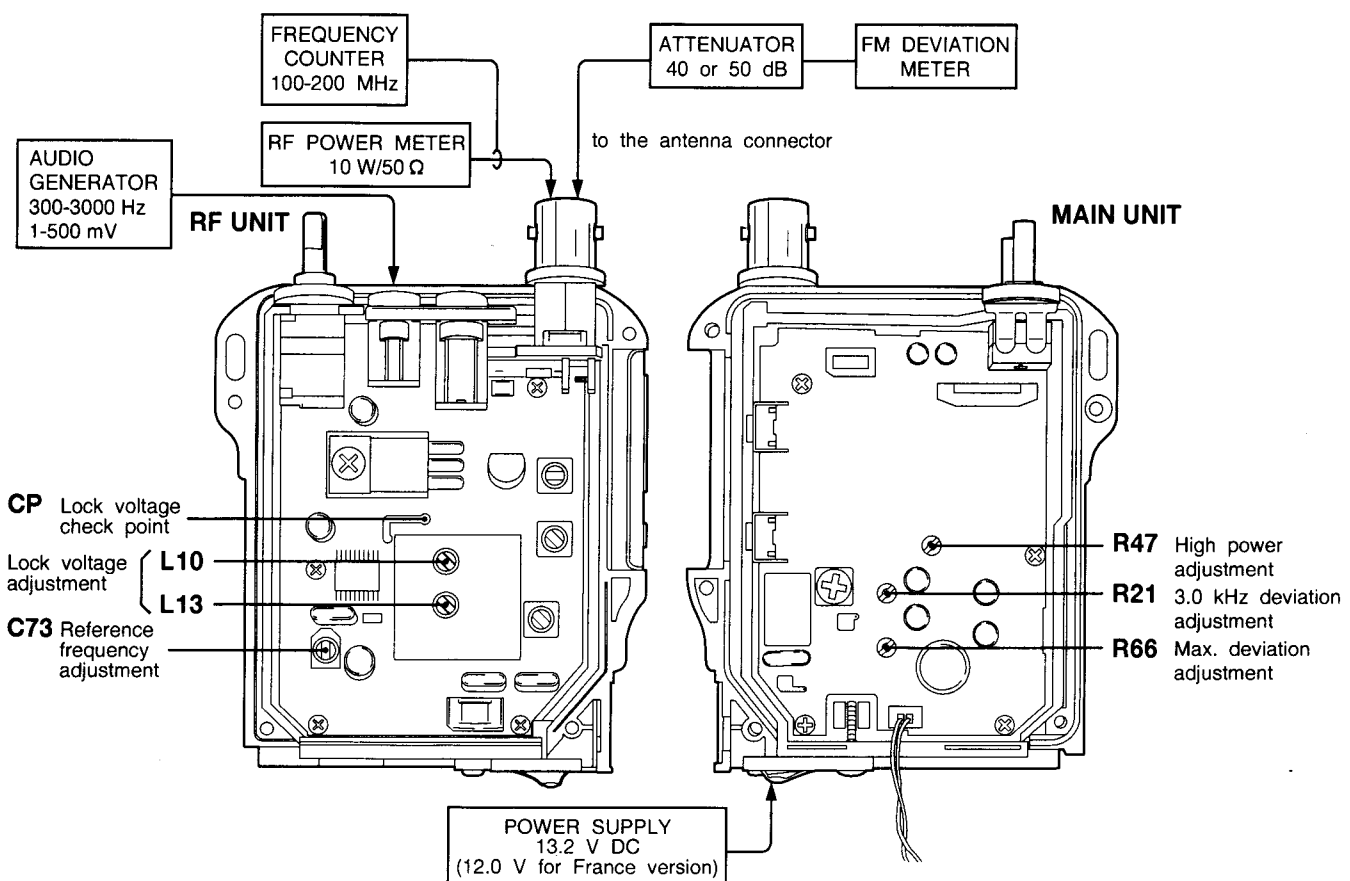

4-5-2 CPU (LOGIC UNIT IC1)

PIN NO.	PORT NAME	DESCRIPTION
1	OPSTB	Outputs a strobe signal to an optional scrambler unit.
2	EPSDA	Used for the memory backup EPROM (IC2).
3	EPSCL	
4	EXSTB	Outputs a strobe signal to the I/O expander ICs (MAIN unit IC3, IC4)
6	LAMPO	Outputs a display backlight signal. "HIGH" for backlight ON.
7	FUNC KEY	Input port for the [FUNC] switch.
8	DOWN	Input ports for the channel selector.
9	UP	
15-18	KI0-KI3	Input ports for the initial matrix and key matrix.
19-23	KS0-KS4	Output ports for the initial matrix and key matrix.
24	OPT IN	Input port for the optional scrambler unit connection.
25	PTT	Input port for the [PTT] switch.
27	BUSY	Input port for the noise squelch signal from the FM IF IC (MAIN unit IC1). "LOW" when the squelch closes.
28	BEEP	Outputs beep tone signals.
29	INT0	Input port for the interrupt signal. "LOW" for CPU stand-by. "HIGH" for CPU operation.
32-56	SEG2-SEG26	Output the LCD drive signal.
63	COM1	Output a common signal for the LCD display.
64	COM2	
74	OSC1	Terminals for CPU clock.
75	OSC2	
76	RESET	Input port for the CPU reset signal.
77	S.CK	Outputs clock signals.
78	UNLK	Input port for the PLL unlock signal.
79	S.DATA	Outputs serial data.
80	PLSTB	Outputs a strobe signal to the PLL IC (RF unit IC1).

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PLL AND TRANSMITTER ADJUSTMENTS

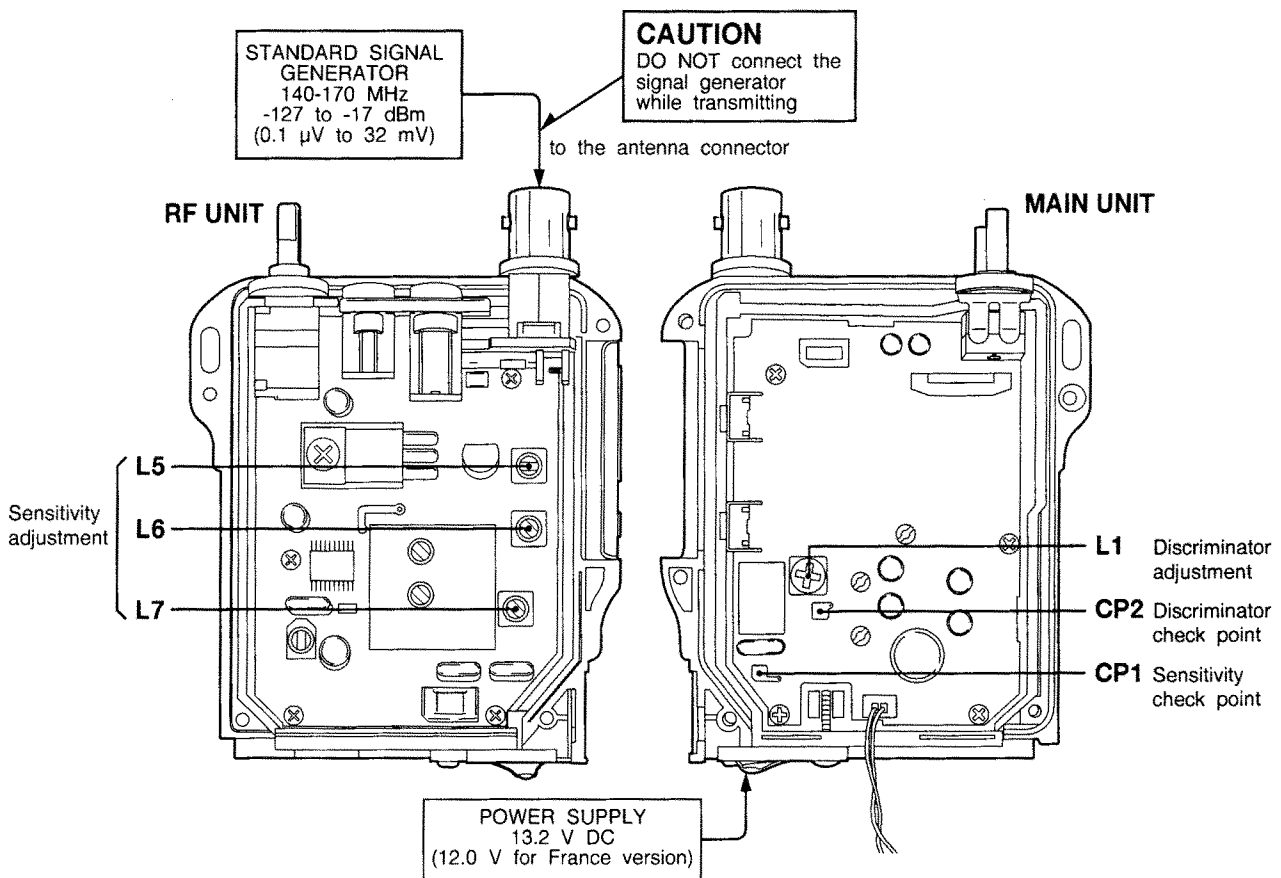

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
PLL LOCK VOLTAGE	1 <ul style="list-style-type: none"> • Operating channel: 16 • Receiving 	RF	Connect a digital multi-meter or oscilloscope to CP.	2.0 V	RF	L10
