About This Manual

The information in this manual is intended to supplement the *FT-5100 Operating Manual*, for servicing the transceiver. Specifications and details of operation and options are provided in the operating manual, and are not reprinted herein. Therefore, this manual is not intended to serve as an independent reference, but to be used in conjunction with the information provided in the operating manual. The FT-5100 is intended to be serviced only by qualified technicians.

Two pcb layout diagrams are provided for each double-sided circuit board in the transceiver. Each side of the board is referred to by the type of the majority of components installed on that side ("leaded" or "chip-only"). In most cases one side has only chip components, and the other has either a mixture of both chip and leaded components (trimmers,

coils, electrolytic capacitors, ICs, etc.), or leaded components only.

While we believe the technical information in this manual is correct, Yaesu cannot assume any liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

The technical information in this manual supercedes all previously published information on this product. Where information is duplicated in this manual and the operating manual, this manual should generally be considered more current.

Yaesu Musen reserves the right to make changes in the circuitry of this transceiver, in the interest of technological improvement, without obligation to owners.

Case Disassembly & Board Locations

- Turn off the transceiver, and disconnect all cables.

Main Unit Solder Side Access

- Referring to Figure 1, remove the six screws from the top cover to expose the solder side of the Main Unit.

Other Units

- Referring to Figure 2, remove the six screws in the bottom cover. When removing the bottom cover, use care not to strain the wires to the loudspeaker.

PCB Locations are indicated in Figure 4.

To access the Control and Panel Units, remove the two screws in the front panel indicated in Figure 3.

Chip Component Information

The diagrams below indicate some of the distinguishing features of common chip components.

Ceramic Capacitors

(Unit : mm)

Type	L	W	T
3216	3.2	1.6	0.45~0.60
2125	2.0	1.25	0.35~0.50
1608	1.6	0.8	0.65~0.95

Tantalum Capacitors

Polarized, Unmarked
(determine value from layout and Parts List)

Examples :
J475 = 6.3V 4.7μF

G	4.0V	D	20V
J	6.3V	E	25V
A	10V	V	35V
C	16V		

Resistors

(Unit : mm)

Type	L	W	T
1/10	2.0	1.25	0.45
1/16	1.6	0.8	0.45

INDICATED LETTERS

1 2 3 4
5 6 7 :
9 0 .

Type RMC 1/10W, 1/16W
Marking* 100, 222, 473.....

9	9	10 ⁹

Examples :

100 = 10Ω
222 = 2.2kΩ
473 = 47kΩ

Replacing Chip Components

Chip components are installed at the factory by a series of robots. The first one places a spot of adhesive resin at the location where each part is to be installed, and later robots handle and place parts using vacuum suction.

For single-sided boards, solder paste is applied and the board is then baked to harden the resin and flow the solder. For double-sided boards, no solder paste is applied, but the board is baked (or exposed to ultra-violet) to cure the resin before dip soldering.

In our laboratories and service shops, small quantities of chip components are mounted manually by applying a spot of resin, placing with tweezers, and then soldering by very small dual streams of hot air (without physical contact during soldering). We remove parts by first removing solder using a vacuum suction iron, which applies a light, steady vacuum at the iron tip, and then breaking the adhesive with tweezers.

The special vacuum soldering/desoldering equipment is recommended if you expect to do a lot of chip replacements. Otherwise, it is usually possible to remove and replace chip components with only a tapered, temperature-controlled soldering iron, a set of tweezers and braided copper solder wick. Soldering iron temperature should be below 280 °C (536 °F).

Precautions for Chip Replacement

- ✗ Do not disconnect a chip forcefully, or the foil pattern may peel off the board.
- ✗ Never re-use a chip component. Dispose of all removed chip components immediately to avoid mixing with new parts.
- ✗ Limit soldering time to 3 seconds or less to avoid damaging the component and board.

Removing Chip Components

- Remove the solder at each joint, one joint at a time, using solder wick whetted with non-acidic flux as shown below. Avoid applying pressure, and do not attempt to remove the tinning from the chip's electrode.

- Grasp the chip on both sides with tweezers, and gently twist the tweezers back and forth (to break the adhesive bond) while alternately heating each electrode. Be careful to avoid peeling the foil traces from the board. Dispose of the chip when removed.

- After removing the chip, use the copper braid and soldering iron to clean away any excess solder and smooth the land for installation of the replacement part.

Installing a Replacement Chip

As the value of some chip components is not indicated on the body of the chip, be careful to get the right part for replacement.

- Apply a small amount of solder to the land on one side where the chip is to be installed. Avoid too much solder, which may cause bridging (shorting to other parts).

- Hold the chip with tweezers in the desired position, and apply the soldering iron with a motion line that is indicated by the arrow in the diagram below. Do not apply heat for more than 3 seconds.

- Remove the tweezers and solder the electrode on the other side in the manner just described.

Notes

Block Diagram

Servicing

Alignment

The FT-5100 is carefully aligned at the factory for the specified performance across the amateur bands. Realignment should therefore not be necessary except in the event of a component failure. All component replacement and service should be performed only by an authorized Yaesu representative, or the warranty policy may be voided.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Yaesu service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Yaesu service technicians realign all circuits and make complete performance checks to ensure compliance with specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Yaesu must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is neces-

sary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

Required Test Equipment

- RF Signal Generator with calibrated output level at 450 MHz
- Deviation Meter (linear detector)
- AF Millivoltmeter
- SINAD Meter
- Inline Wattmeter with 5% accuracy at 450 MHz
- Regulated DC Power Supply adjustable from 10 to 17 V, 15 A
- 50- Ω Dummy Load: 100 W at 450 MHz
- Frequency Counter: 100-Hz resolution and ± 0.2 -ppm accuracy at 450 MHz
- AF Signal Generator
- DC Voltmeter: high impedance
- UHF Sampling Coupler

Alignment Preparation & Precautions

A 50- Ω dummy load and inline wattmeter must be connected to the antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except power supply, dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this tem-

perature be held constant between 20 and 30 °C (68 – 86 °F). If the transceiver is brought into the shop from hot or cold air it should be allowed some time for equalization with the environment before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Most alignment procedures call for tuning the transceiver to the high or low band edge, or to band center. The actual frequency differs between different versions, so the technician should make sure of the band limits of each set to be aligned before beginning.

Note: Signal levels in dB referred to in the alignment procedure are based on 0 dBμ = 0.5 dBμV.

Reference Oscillator & PLL VCV

Connect the 50-ohm dummy load to the antenna connector and maintain the supply voltage at 13.6 V for all steps.

Reference Oscillator

- Couple the frequency counter to sample the RF output.
- Key the transmitter and adjust TC1001 on the Main Unit to match the display to the counter frequency (within 100 Hz).

VHF PLL VCV (Varactor Control Voltage)

- Connect the negative lead of the DC voltmeter to chassis ground, and the positive lead to the side of C1258 nearest VR1006 on the chip-only side of the Main Unit.
- Set the transceiver to 144.000 MHz, and adjust T801 through the hole in the VHF VCO housing on the leaded-component side of the Main Unit for 1.0 V on the voltmeter while receiving.
- Key the transmitter while adjusting T802 (also in the VHF VCO housing) for 1.5 V on the voltmeter.

UHF PLL VCV Check (no adjustment)

- Connect the positive lead of the DC voltmeter to the solder pad shown in the diagram

of the leaded-component side of the Main Unit.

- Tune to 430.000 MHz (432.000 MHz in version D) and confirm the VCV is between 1.5 and 4.5 V while receiving, and between 2.5 and 5.5 V while transmitting.

Transmitters

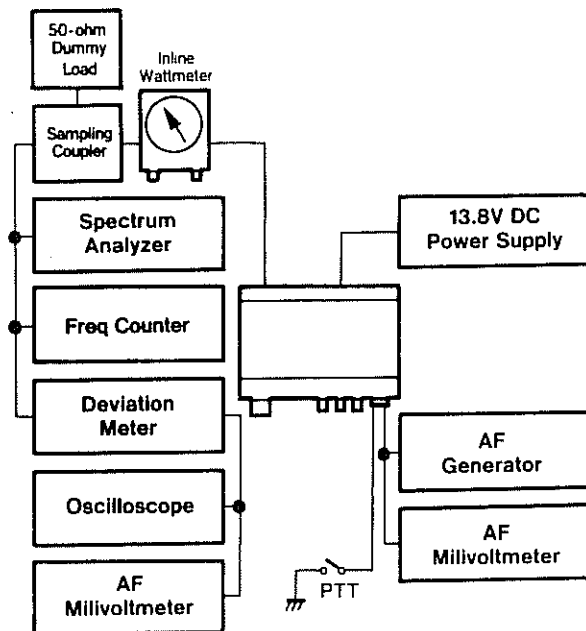

For all of these procedures, connect the test equipment as shown below, and refer to the diagrams on pages 2-5 and 2-6 for test point locations.

VHF Power Output

- Tune to band center (for the version being aligned), and press the **LOW** button, if necessary, to select high power output.
- Key the transmitter and adjust VR102 on the 144-MHz PA Unit for 50 watts on the wattmeter (*use care not to exceed 60 watts during the alignment*).
- Press the **LOW** button to select low power, key the transmitter, and confirm 3 to 6 watts on the wattmeter.

UHF Power Output

- Perform the same steps as above for VHF, adjusting VR1003 on the Main Unit for 35 watts on the wattmeter (*do not exceed 42 watts*).

Transmitter Alignment Setup

VHF Automatic Final Protection (AFP)

- Disconnect the dummy load from the antenna connector.
- Key the transmitter and adjust VR103 on the 144-MHz PA Unit for 5 A on the DC supply ammeter.
- Reconnect the dummy load, and connect the DC voltmeter to the lead of C140 nearest VR103 (adjusted above).
- Key the transmitter and adjust VR101 for minimum voltage on the voltmeter.

UHF Automatic Final Protection (AFP)

- Disconnect the dummy load from the antenna connector.
- Key the transmitter and adjust VR1002 on the Main Unit for 5 A on the DC supply ammeter.
- Reconnect the dummy load, and connect the DC voltmeter to the cathode of D1003 on the Main Unit.
- Key the transmitter and adjust VR1001 for minimum voltage on the voltmeter.

VHF Transmitter Deviation

- While tuned to the center of the band, adjust the AF generator attenuator for 50-mV output at 1 kHz to the MIC jack.
- Key the transmitter and adjust VR1006 on the Main Unit for ± 4.5 kHz deviation on the deviation meter.
- Reduce the AF injection until the deviation meter shows ± 3.5 kHz deviation, and confirm that the injection level is 4 to 6 mV.

UHF Transmitter Deviation

- Perform the above steps for VHF, adjusting VR1007 on the Main Unit.

Receivers

Set up the test equipment as shown here for receiver alignment.

VHF Interstage Transformers

- Tune the transceiver and RF signal generator to the center of the VHF band. Modulate the RF signal generator with ± 3.5 kHz deviation of a 1-kHz tone.

- Adjust T1001 through T1007 on the Main Unit for optimum maximum S-meter indication.
- Confirm -8 dB μ or better 12-dB SINAD at the high and low band edges.

UHF Front End BPF

- Retune the transceiver and signal generator to the center of the UHF band, and perform the above (VHF) steps, adjusting only TC-1003 on the Main Unit for optimum 12-dB SINAD.

VHF Squelch Preset

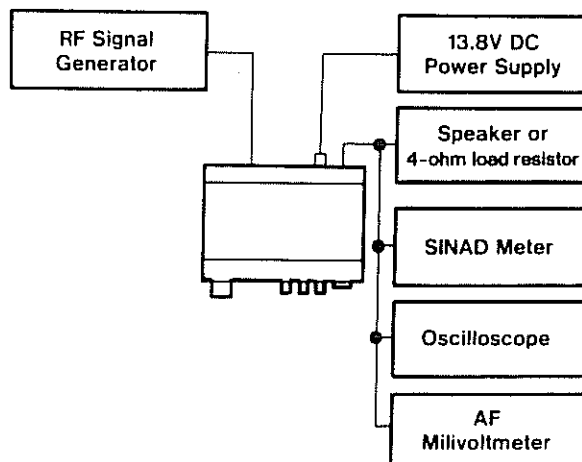

- Tune to the center of the VHF band, and inject -15 -dB μ RF modulated with ± 3.5 -kHz deviation of a 1-kHz tone to the antenna connector.
- Set the SQL control to the 10-o'clock position, and adjust VR401 on the IF Unit so the squelch just closes.

UHF Squelch Preset

- Retune the transceiver and RF signal generator to the center of the UHF band, and with the same injection level and modulation as for VHF, adjust VR402 so the squelch just closes.

VHF S-Meter Calibration

- At the center of the VHF band, inject 25-dB μ RF modulated with ± 3.5 kHz deviation of a

Receiver Alignment Setup

1-kHz tone to the antenna connector. Adjust VR405 on the IF Unit so that all S-meter segments are just on.

UHF S-Meter Calibration

- Tune the transceiver and RF signal generator to the *center* of the UHF band and with the same injection level and modulation, adjust VR406 so that all S-meter segments are just on.

VHF Scanner Center-Stop

- With both the transceiver and signal generator tuned to the center of the VHF band, set the signal generator for 30-dB μ RF modulated with ± 3.5 -kHz deviation of a 1-kHz tone.
- Connect the DC voltmeter (3-V range) between TP401 (+) and TP402 (-) on the IF Unit, and adjust VR403, if necessary, for zero volts on the meter.
- Reduce the injection level to 10 dB μ , then press the UP or DWN button on the micro-

phone for more than $\frac{1}{2}$ second to start scanning. Confirm that scanning stops at the injection frequency.

UHF Scanner Center-Stop

- Move the DC voltmeter to TP403 (+) and TP404, tune the transceiver and signal generator tuned to the center of the UHF band and perform the above (VHF) steps, adjusting VR404 for zero volts with 30 dB μ injection.

Single-Band/Dual-Receive Sensitivity

- With both the transceiver and signal generator tuned to the center of *either* band, set the signal generator for 30-dB μ RF modulated with ± 3.5 -kHz deviation of a 1-kHz tone at the antenna connector.
- Adjust T1008 on the Main Unit for optimum 12-dB SINAD, then confirm -6 dB μ or better 12-dB SINAD at the high and low band edges.

Pilot Lamp Replacement

- ❑ Remove the top and bottom covers, as shown in *Case Disassembly* on page 1-2.
- ❑ Pull the knobs off the panel, and unscrew the ring nuts affixing the mic jack and the tuning shaft (you may be able to do this with long-nose pliers, or have your dealer do it with a special wrench).
- ❑ With a jeweler's screwdriver, remove the tiny screw on the circuit board just left of the mic jack, and then remove the circuit board.
- ❑ Referring to Figures 1 and 2, unsolder the old bulbs and install the replacements.
- ❑ Reassemble the transceiver in the reverse order of the above.

Figure 1

Figure 2

P/N Q1000078
10V 60mA.

Backup Battery Replacement

- ❑ Remove the top and bottom covers, as shown in *Case Disassembly* on page 1-2.
- ❑ Remove the 5 screws affixing the Control Unit. Then using care to avoid straining or creasing the flexible circuit board between the Control and Panel Units, separate the two boards.
- ❑ Referring to Figure 3, unsolder the battery terminals and install the replacement.
- ❑ Replace the Control Unit and covers.

Resetting the CPU

Resetting the CPU clears all memories, repeater shifts and other settings to their defaults, and leaves the transceiver CPU in the same state as when it left the factory.

A *soft* reset can be done by holding the D/MR and REV keys while switching the transceiver on. If a CPU-related problem remains after the soft reset, a *hard* reset can be done as follows:

- Turn the transceiver off, and disconnect all cables.
- Remove the top and bottom covers and the front panel, as shown in *Case Disassembly* on page 1-2.

- Remove 15- Ω chip resistor R1031 from the Main Unit.
- Temporarily short across capacitor C5002.
- Install another 15- Ω (chip or leaded) resistor in the same place where R1031 was removed.
- Replace the front panel and covers.

FTS-22

Tone Squelch Unit Installation

The FTS-22 includes an encoder and decoder for 38 EIA standard subaudible CTCSS tones, programmable from the front panel of the FT-5100. It provides silent monitoring of busy channels when activated by the EN-Code/DECode Tone Squelch function. Tone squelch operation on both channels or bands requires only one FTS-22. See the *Operation* chapter of the Operating Manual for functional details.

- ❑ Disconnect the power cable, and turn the set upside-down. Referring to Figure 1, remove the six screws affixing the bottom cover, and remove the cover.

- ❑ Referring to Figure 2, locate unused 12-pin connector J5005 inside the front panel.
- ❑ Peel the covering from one side of the double-sided tape provided with the FTS-22 and stick it on the top of the VCO housing just behind J5005.
- ❑ Note in Figure 3 how the FTS-22 cable routes over the top of the board. Plug the FTS-22 cable into J5005. Then peel the covering from the exposed side of the tape, and press the FTS-22 onto it.
- ❑ The factory adjusts the output tone level (VR1 on the FTS-22) for the proper deviation, so it should require no further adjustment.
- ❑ Replace the bottom cover removed in the first step.
