1. Introduction

Thank you for purchasing the HL-1.5KFX. This compact and lightweight desktop HF/50MHz linear power amplifier has a maximum input power of 1.75kW. Our solid-state broadband power amp technology makes it the smallest and lightest in the industry.

Typical output power is 1kW PEP/SSB on HF and 650W on 6m band with the drive power of 85-90W. The built-in band decoder will let you forget about the band setting when the amplifier is connected to your modern radio through such band data cables as ICOM CI-V, DC voltage (ICOM, Yaesu), and RS-232C (Kenwood). See the appendix page 27 for the list of the recommended radios. All the data cables are included in your amplifier for your convenience.

2. Cautions

2-1 Unpacking the amplifier, check the fan guard (net) at the rear panel to see if there is any damage caused by the physical shock during the transportation.

The amplifier is cooled by forced airflow. Several inches of clearance on the top and the rear wall are necessary to allow for smooth air intake into the fan. Do not block the air vents on the top cover.

2-2 Keep the amplifier out of direct sunlight, in a cool dry environment

2-3 Internal high voltages, (AC, DC and RF), are present at all times, ON AIR or OFF. Internal access should be limited to avoid injury.

2-4 Turn off the AC main power immediately upon any unusual sounds, sights or odors. Check the multimeter readings of Vd and Id, the fuses and all cable connections around the amplifier. Please notify the dealer or the factory of any problems.

2-5 For your safety, do not operate the amplifier without adequate grounding. A proper ground connection will result in peak performance and stability, in addition to reduced RF strays or noises.

2-6 To eliminate the RF interference to such home appliances as TV, FM radio, telephone sets, and etc., it is recommended that clamp-on ferrite cores be inserted at both ends of the remote control cable, ALC cable, coaxial jumper cable, and antenna cables, as needed. Also, a common mode AC line filter (near the AC outlet), and in-line low pass filters on the antenna coaxial cable, (as necessary), are recommended.

2-7 The amplifier has fast acting sophisticated protection circuits controlled by the latest
microprocessor technology. Please note, however, any such actions that cause the same fault to occur repeatedly, will lead to failure of the valuable final power FET transistors. Also note that the **full power CW (or carrier)** drive under the erroneous **MANUAL BAND SET** leads to the failure of the final power FET’s. (See Section 6, at page 11.) In this sense, it is highly recommended that the amplifier is connected to the radio with supplied Band Data Cable.

2-8 Before checking inside the amplifier, be sure to wait a few minutes for the high DC voltage to discharge (monitor Vd meter reading). The potentiometers for RF power detector, protection circuits, FET bias voltage circuit, etc, are precisely adjusted at the factory, and should not be altered. Doing so, would require readjustment with precision measuring instruments.

2-9 The primary power transformer is factory pre-wired for AC 230V operation. Sliding the select switch located on the bottom of the chassis will switch the voltage from 230V to 115V. (See AC Power section.) Be sure to verify switch selection before you plug the AC power cord into the outlet.

2-10 Before powering on the amplifier, be sure to connect a dummy load (50 ohms, 1kW min.) or a well-adjusted antenna to the output terminal. Operating without any load will cause extreme stress to the RF power FET’s, although protection circuits should work under critical conditions.

2-11 Required drive power is slightly less than 100W to obtain the full 1kW output. Do not attempt to operate with excessive drive from a high power transceiver. Transmitting high driveRF (over 100W) into the amplifier will void the warranty.

2-12 Keep the aluminum heat sink and air openings free from dust and blockages. Periodic cleaning will prevent degraded cooling efficiency.

2-13 For long continuous operation in RTTY modes, it is recommended you reduce the RF drive levels by 20% to 30% lower output than CW/SSB modes. Optional Fan Kit recommended.

2-14 To prevent damage to the precision electronic components, avoid extreme physical shock to the amplifier. If factory service is required, the amplifier **MUST** be shipped using the original box and packaging materials.
3. Features

3-1 Our solid-state broadband design engineers worked to make the HL-1.5KFX, the lightest and most compact 1kW HF amplifier in the industry. This world-class compact 1 kW HF/6m amplifier is the easiest to handle and operate.

3-2 The amplifier is equipped with a newly developed band decoder. The amplifier’s decoder changes bands automatically as the data signal is received from the associated HF transceiver’s frequency bands.

3-3 The amplifier’s main PA section includes 4 high power MOS FET SD2933’s by ST Micro, resulting in 1kW PEP (SSB max.) on HF and 650W on 6m. The amplifier’s broadband characteristics require no further tuning once the operating band is selected.

3-4 The amplifier allows operation in full break-in CW mode due to the use of the amplifier’s high-speed antenna relays (made by Panasonic/Matsushita).

3-5 With the unique duct structure design and the powerful blower fan, the aluminum heat sink block for RF PA module (and other components), are effectively cooled. The fan’s quiet operation allows for even the weakest DX signals to be heard.

3-6 The amp utilizes an advanced 16 bit MPU (microprocessor) to run the various high speed protection circuits such as overdrive, high antenna SWR, DC overvoltage, band miss-set etc.

3-7 This amplifier is compatible with both AC 230V (200/220/240V included) and AC 115V (100/110/120V included). See the illustration in the AC Power Section for changing primary wiring of the power transformer.

3-8 For the safety of the operator, an Interlock system is employed. The AC power is shut down if the top cover is removed, and the automated safety interlock is activated.

3-9 An analog multimeter allows the operator to monitor Pf (Forward output power), Pr (Reflected power), Vd (Drain voltage of power FET), Id (Drain current) etc

3-10 For future expansion, the amplifier rear panel is equipped with a control cable connection socket, this is for the upcoming model HC-1.5KAT, auto antenna tuner by Tokyo Hy-Power Labs. Early 2007
4. Specifications

Frequency : 1.8 ~ 28MHz all amateur bands including WARC bands and 50MHz
Mode : SSB, CW, RTTY
RF Drive : 85W typ. (100W max.)
Output Power : HF 1kW PEP max., 900W CW (typ.)
               50MHz 650W PEP max.

Matching Transceivers for Auto Band Decoder : Most ICOM, Yaesu, Kenwood

Drain Voltage : 53V (when no RF drive)
Drain Current : 40A max.
Input Impedance : 50Ω (unbalanced)
Output Impedance : 50Ω (unbalanced)
Final Transistor : SD2933 x 4 (MOS FET by ST micro)
Circuit : Class AB parallel push-pull
Cooling Method : Forced Air Cooling
MPU : PIC 18F8722
Multi-Meter : Output Power Pf 1kW
              Reflected Power Pr 100W
              Drain Voltage Vd 60V
              Drain Current Id 50A

Input/Output Connectors : UHF SO-239 with low loss Teflon insulator
           AC 115V (100/110/120V)  20A max.
AC Consumption : 1.9kVA max. when TX
Dimension : 272 x 142 x 363 mm (WxHxD)
            10.7 x 5.6 x 14.3 inches
Weight : Approx. 20kgs. or 45.5lbs.
Accessories : AC Power Cord x 1
              RCA Plug x 2
              Band Decoder Cable x 4
              Spare Fuse 15A (for AC 230V line) x 2
              Spare Fuse 25A (for AC 115V line) x 2

              Spare Fuse 1A (Miniature Fuse) x 3
              (For PC1664, main control board x 1,
               For PC1662, power amp board x 1)
Spare Fuse 2A (Miniature Fuse) x 1
(For PC1611 FN DC-DC board x 1)
User Manual x 1

Optional Items:
- Auto Antenna Tuner (HC-1.5KAT) (future)
- External Cooling Fan (HXT-1.5KF for high duty cycle RTTY)
5. AC Line Voltage

5-1 Although the amplifier is designed to work with both AC 115V (100-120V) and AC 230V (200-240V), for stability we recommend operation from AC 230V.

5-2 The correct AC plug (not included in the package), must be obtained locally due to the AC plug variations worldwide.

5-3 The AC voltage has been factory preset for 230V use (or as requested by the customer at the time of order). If you wish to change to AC 115V, change the voltage setting by sliding the switch knob located on the chassis bottom, (as illustrated below). See the other illustration for AC voltages other than 230/115V. For your safety, before making these adjustments, be sure to pull the AC plug from the AC outlet to avoid injury.
6-A. Front Panel Description

1. **POWER**  Main power switch to turn AC power on and off.
   LED (green) lights when turned on.

2. **OPER.**  OPERATE /STAND-BY switch. At OPERATE, the amplifier is ready to go into
   ON AIR (TX) mode and at STBY, it is on STAND-BY mode.

3. **METER**  To change the multimeter scales. Meter reads Pf, Pr, Vd, and Id.

4. **BAND SELECT**  To select band switching methods AUTO or MANUAL. When using AUTO,
   the manufacturer for the transceiver in use should be selected. When the
   band data cable is not used, MANUAL should be selected. (See page 14, 9.
   Band Data cable Connection)

5. **UP, DOWN**  Push switch for band change in manual mode. While the transceiver is on
   Receive (RX) mode, push the button to select the desired frequency band to
   operate. The switches will not work when the transceiver and the amplifier
   are in Transmit (TX) mode.

6. **ANT**  Select switch for antenna A or B. A and B are selected alternatively, as the
   switch is pushed. The selected antenna is stored in the memory for the
   respective bands. Note the antenna switch always defaults to A when the
   POWER switch is turned off.

7. **FAN, ID, ON AIR**
   7-1 **ON AIR**: Green LED lights when the amplifier is in transmit (TX) mode.
   7-2 **FAN**: This LED lights when the cooling fan runs at high speed. When the PA heat
   sink temperature reaches 40 degrees C, the fan will run at high speed for
enhanced cooling. If the FAN LED is lit, it is recommended that the power switch not be turned off immediately after finishing operation. Allow the cooling fan to run for an extended period of time.

⑦-3 ID  :  Excessive Id Indicator (> 35A). Depending on the band and antenna situation, high drain current may flow into FET’s. If 35A is exceeded, this LED flickers and/or lights to indicate that high Id is being drawn. (This light does not necessarily mean a failure of the amplifier. However if it lights too often, or too long, it is possible the drive power should be reduced and the antenna should be checked for SWR, to avoid stress to the FET’s).

⑧  O.DRIVE, O.HEAT, O.VOLT, FUSE, PR

⑧-1 O.DRIVE : When overdrive or band miss-set is detected, LED lights to indicate the protection circuit has worked.

⑧-2 O.VOLT : When the DC drain voltage of the FET’s (Vd) is too high, the LED lights to indicate the protection circuit has worked.

⑧-3 O.HEAT : When the PA module temperature reaches 70 deg. C, the LED lights to indicate the protection circuit has worked. (It is necessary for the cooling fan to operate for several minutes to cool the PA module).

⑧-4 FUSE : LED lights when the 15A glass fuse has blown from excessive Id. (Two 15A fuses are on the PC1622 PA board.)

⑧-5 PR : LED lights when reflected power from antenna exceeds 80W to indicate protection circuit has worked.

(Turning the main POWER switch to off, and then on again can reset the Protection Circuits.)

⑨  BAND
One of the green LED lights will indicate which band is selected for operation.

⑩  MULTIMETER  Pf (Forward output power), Pr (Reflected power from antenna), Vd (FET drain voltage), and Id (FET drain current) are shown on the scale as selected by ③ METER select switch.
6-B. Rear Panel Description

1. **ANT A**  RF Output Connector. Connect the coax cable to the antenna.
2. **ANT B**  RF Output Connector. Connect the coax cable to a second antenna or a dummy load (50Ω 1kW for example).
3. **INPUT**  RF Input Connector. Connect the coax jumper cable from the transceiver.
4. **AC POWER**  AC Mains Socket. Socket for the AC power cord. (Socket is EMI filtered.)
5. **GND**  Ground Terminal.
6. **SEND**  RCA Jack. Connect the control cable from the ACC terminal (or SEND, TX GND etc.) of the transceiver. The center pin is to be shorted to ground through the relay circuit of the transceiver. The DC current flowing into your radio to key the amplifier to transmit is as low as 5V, 1mA.
7. **ALC**  RCA Jack for ALC Voltage Output. Negative DC voltage appears at the center pin, which is fed back to the ALC terminal of the transceiver. ALC is used to keep the amplifier output power at certain limits. Also it is useful when the transceiver output power is higher than 100W. (See page 13. 8. ALC Connection). Also consult your HF transceiver’s user manual.
8. **ALC ADJ.**  Potentiometer to adjust ALC voltage level. Minus 10V is available at maximum, when turned full counter-clockwise. Factory setting is 0 volts, with the pot turned full clockwise.
9. **FUSE**  A pair of fuses for AC Mains. 15A glass fuse. (Change to 25A fuses if 115V line voltage is selected.)
10. **ICOM**  RCA Jack for the DC voltage derived band data cable from the ICOM transceiver. (reference page 14, BAND DATA CABLE CONNECTION WITH...
ICOM.

11 CI-V
Earphone jack for CI-V band data cable for ICOM transceivers so equipped. (See page 16.)

12 BAND DECODE
Slide switch to select band data communication method with ICOM transceivers. This selects either “DC voltage band data” or “CI-V band data”.

13 TUNER
DIN Socket for External Auto Antenna Tuner. (Our HC-1.5KAT is expected to be available in 2007.)

14 YAESU
DIN Socket for band data cable from the Yaesu transceiver. (See page 16.)

15 KENWOOD
D-Sub (9 pin) socket for band data cable for Kenwood transceivers (RS-232C). (See page 18.)

16 EXTERNAL FAN POWER
Plastic Female Connector for DC power supply cable to feed the optional external cooling fan kit (HXT-1.5KF).

7. Chassis Bottom Description

1 AC 115/220V
Slide switch to select AC line voltage. Set to 220V for 200/220/230/240V. Set at 115V for 100/110/115/120V lines.
Fuse socket for the External Cooling Fan Unit, HXT-1.5KF. When the optional fan is installed on top of the cover, a 2A glass fuse is recommended.

6. Connection & Operation
This section explains a one-antenna system or two antenna system with basic connections to the transceiver, where no band data cable is connected. In this case, band setting is made with MANUAL mode, pushing UP/DOWN keys. Advanced operation using the band data cable is described in Section 9.

**CAUTION:** Under the Manual Band Set operation, always be sure to check if BAND Switch position matches that of your radio before keying PTT or the CW paddle. Also when you have changed the BAND, do not make the full power CW (carrier) drive but reduced level power to see if the BAND is set correctly and the amplified RF power comes out properly. *Full power CW drive under the BAND Miss-Set leads to the failure of the valuable final power FET devices.* **

**One Antenna System Example**
Two Antenna System Example

7-1 Connect AC cord and coax cables as illustrated above. Connect the cable from “SEND” to ACC or the remote terminals of transceiver, where it is marked “SEND” or “TX GND”. These terminal pins are shorted to ground when the transceiver is in TX/ON AIR mode. If these connections are not made, the amplifier will not go into TX (amplification) mode. For a temporary check to the amp, ground the SEND center pin by inserting an RCA plug whose center pin has been soldered to the outer case of the plug with a small piece of wire. As a side note, this SEND terminal is pulled up to a DC 5V level that is connected to a internal microprocessor pin. When grounded, DC sink current of 1 mA (only) will flow. The transceiver’s control circuit is under a very light load.

7-2 At first, turn the ALC knob full clockwise to avoid ALC voltage to the transceiver. Application of ALC will be covered in the following section 8.

7-3 Keeping the POWER (AC mains) switch off, check the SWR of your antenna by keying the transceiver to TX mode (CW or RTTY mode). Monitor the SWR with an external SWR/Power meter. If SWR is 1.8 or higher at band center, the antenna has to be adjusted for lower SWR. As an alternative, an antenna tuner may be inserted.

7-4 Turn the POWER switch on. Turn the BAND switch to MANUAL position. Then push UP/DOWN keys to select desired band. Turn the STAND-BY switch to OPER (operate) position and the amplifier is ready to go. If you key the transceiver with the carrier level set relatively low (such as 20-30W), you will achieve an amplified output signal of a few hundreds watts. Monitor this output with the multimeter in the (Pf position) or with an external power meter. Increase drive level to
roughly 50W and see if the antenna SWR stays constant. (As higher RF currents flow some antennas may show a changed SWR value due to heated connector junctions and trap coils.)

7-5 You can now increase the drive level to nearly 80-90W to achieve maximum carrier output power of 900W (CW, RTTY) from the amplifier. If you change to SSB mode, peak voice power will reach approximately 1kW. For high duty cycle transmissions like RTTY, SSTV, or FM modes, it is recommended you reduce the drive power by 20-30% compared with SSB/CW. In AM mode, the drive power should be strictly reduced to one third of SSB, or 30W at most, otherwise modulated amplitude peaks will be distorted.

7-6 With a high power transceiver in SSB mode, you can overdrive the amplifier resulting in a distorted output signal. This can also occur if you speak too loud or if you set the microphone gain too high. Speak into the microphone properly to reduce the possibilities of splattering into the neighborhood. The ALC is effective in preventing the output signal from being distorted or to limit the carrier level to within rated output levels. As long as you do not overdrive, you can disregard the ALC connection. See Section 8, ALC CONNECTION for details.

7-7 Protection circuits may work during operation depending on the conditions. If the protection circuit has shut down the amplifier, check the antenna SWR, Vd, AC line voltage, or try to reduce the drive level. To reset, turn off the POWER switch once, then back on again. The power transformer has an overheat protection in the coil layer. If this temperature switch activates, the amplifier will put you in receive mode with the cooling fan operating until the transformer has cooled off. It may take ten to fifteen minutes to cool, depending upon room temperature. For more details on this protection circuit, see Section 10.

8. ALC Connection

ALC voltage is available at the terminal marked ALC (RCA phono jack) on the right upper corner of the rear panel. Negative maximum DC voltage of ten volts (-10V) is produced at this terminal when the amplifier is fully driven. This voltage is adjustable with the ALC ADJ. knob located above the ALC jack. If the ALC voltage is properly fed back to the transceiver, we advised you to keep the maximum output power constant or hold the power at a certain level. Also ALC is useful in avoiding your SSB signal from being distorted when overdriven. You may not always need to connect ALC to the transceiver, if you set the mic gain properly and do not overdrive the amplifier. Depending upon the manufacturer of the transceiver, the suitable ALC voltage differs. ICOM may need 0--4V, and Yaesu may need 0--6.5V range. Kenwood may need -6--8V maximum. Check your transceiver manual.

8-1 Prepare an ALC control cable using the RCA plug supplied in the package. Solder a single wire
or (more preferably) a shielded single wire to the center pin of RCA plug and solder the shield braid to the outer side of the plug. Connect the control cable to the "ALC (or EXTERNAL ALC)" jack of the transceiver. External ALC input is sometimes available at one of the pins of the "ACC" socket of the transceiver as well.

8-2 At first, turn ALC ADJ full clockwise. Drive the amplifier in CW/RTTY mode to full output power. Then turn the ALC ADJ counter-clockwise. Observe the SWR/Power meter at the output, (or Pf of the multimeter). Stop turning the ALC ADJ at the point the power starts to decrease. Or if you wish to further reduce the power, keep turning ALC ADJ until the desired level is achieved. If you further try to increase the drive power you will now see the output power become rather saturated, from these adjustments,

(Maximum ALC voltage produced is -10V when the amplifier output is over 200W)

![Diagram](image-url)
9. Band Data Cable Connection

Connection methods with ICOM, Yaesu and Kenwood transceivers are described here in detail respectively. This connection enables the automatic band setting of the amplifier with the band set command from the transceiver. Four types of cable connections are explained.

9-1 ICOM DC Voltage Band Data

For your safety, please turn off the power (AC) to both the transceiver and amplifier. Connect the cable (for ICOM DC Voltage Band Data Connection) as shown in the following illustration.

Slide the "BAND DECODE" slide switch on the rear panel toward "ICOM". (Other side is for CI-V.)

Set the "BAND SELECT" rotary switch on the front panel to "ICOM". Now turn on the AC to the transceiver, and then turn the POWER switch to the amplifier on. Observe that the band indicator (LED) of the amplifier matches that of the transceiver.

Note: This connection is for ICOM models of 746, 756, 7800 etc. (706MK II G & 7000 need a special connection to the ACC socket using the ICOM supplied accessory cable assembly. See the 706/7000 manual).
9-2 ICOM CI-V

The following initial settings are needed on the ICOM transceiver:

CI-V BAUDT RATE : 9600
CI-V ADDRESS : 5ch
CI-V TRANSCEIVE : ON
CI-V with IC-731 : OFF

(For details, refer to your ICOM radio manual.)

Turn off the power (AC) to both the transceiver and amplifier. Connect the following CI-V band data cable as shown in the illustration.

Slide the BAND DECODE switch knob to the CI-V side. BAND SELECT rotary switch on the front panel should be set to the ICOM position.

Make sure the transceiver is in receive mode. Turn on the POWER switches to the transceiver and the amplifier. Observe that the band indicator (LED) of the amplifier matches that of the transceiver.
9-3 Yaesu Band Data

Using the Yaesu band data connection cable (shown below), connect the transceiver (example, FT-1000MP MK-V) to the HL-1.5KFX.

Turn off the AC POWER to the transceiver and the amplifier. Connect the 8 pin DIN plug to the BAND DATA (8 pin) socket of the Yaesu transceiver. Connect the other end, the 5 pin DIN plug to the YAESU of 5 pin DIN socket on the rear panel of the amplifier.

Check and make sure that the transceiver is in receive mode. Power up the transceiver and then turn on the AC POWER to the amplifier. Observe that the band indicator (LED) of the amplifier matches that of the transceiver.
9-4 Kenwood RS-232C Band Data

Using the Kenwood band data connection cable (shown below), connect the transceiver (example TS-950, TS-870) to the HL-1.5KFX as illustrated below.

Initial settings for the transceiver are as follows:

- **Communication Speed**: 9600 (bps)
- **Stop Bit**: 1 bit

(Refer to the Kenwood radio manual for more details).

Turn off the AC POWER to the transceiver and the amplifier. Connect the D-SUB (9 pin) plug to the COM (D-SUB 9 pin socket) on the rear panel of the Kenwood transceiver. Connect the other D-sub 9 pin plug to the KENWOOD (D-SUB 9 pin socket) on the rear panel of the amplifier.

Check that the transceiver is in receive mode. Turn on the AC POWER to the transceiver and the amplifier. Observe that the band indicator (LED) of the amplifier matches that of the transceiver.
10. Protection Circuits

There are five major protection functions in this amplifier. If the amplifier has shut down for some reason, before re-setting, correct the possible cause of the shut down. Turn off the POWER once and back on to reset.

10-1 O.DRIVE (Over Drive/ Band Miss-set)
When the drive power exceeds the 100W level, the amplifier will shut down to STAND-BY mode (or receive) in order to protect the input side of the power FET's. This protection might also activate if the band is set wrong. This usually occurs, in MANUAL BAND mode, when the amplifier band setting is lower than that of the transceiver. To comply with FCC rules any RF between 26.0-28.0MHz will cause Amplifier to shut down and not operate.

10-2 O.HEAT (Over Heat)
When the temperature of the aluminum heat sink in the power amplifier reaches 70 degrees C, the amplifier defaults to RECEIVE mode to protect the power FET's. Likewise, if the temperature of the inside layer of the power transformer reaches 130 deg. C, the amplifier will default to RECEIVE mode for your safety. O.HEAT protection cannot be reset until the heat sink or transformer has sufficiently cooled off.

10-3 O.VOLT (Over Voltage)
If there is a sudden AC line voltage spike, or if the transformer primary develops a fault, the FET drain voltage may rise above acceptable levels. If O.VOLT protection trips, check the AC line voltage with a circuit tester or an AC voltmeter.

10-4 FUSE (Fuse Blown)
If either of the glass fuses (20A) on PC1662 fails, O.VOLT protection activates. Under normal usage of the amplifier, this failure should rarely (if ever) occur. If it occurs, there is a possibility that the power FET's have failed together. If the amplifier cannot be reset, consult with the dealer or the service center.

10-5 PR (Reflected Power Protection)
If reflected power because of the antenna reaches approximately 80W, the PR protection may trip. If it does, one solution is to reduce the drive power from the transceiver. Or you may need to check that your antenna match (SWR) is still ok. If the match cannot be corrected and the antenna system isn’t faulty, use an antenna tuner.

As noted above, the amplifier is equipped with several kinds of fast acting protection circuits using the latest in microprocessor technology. However, if the amplifier is operated in such a manner
that multiple protections work repeatedly over a long period of time, the amplifier can be seriously damaged.

11. Explanation of Major Circuits
Five major circuit blocks are explained in there basic form and using signal flows.
11-1 Main DC Power Supply
11-2 Power Amp, L.P.F.
11-3 RF Power Detector, TX/RX Switching
11-4 Main Controller
11-5 Band Decoder, Frequency Counting

11-1 Main DC Power Supply
The main DC power supply feeds the 50V DC power to the final PA stage. It is a non-regulated power supply and consists of the compact power transformer using an oriented core, a bridge diode rectifier, and a high capacity electrolytic capacitor of 68,000uF for the filter. A soft start circuit suppresses the AC rush current using a thyristor. A part of 50V line is converted to 24V using a DC-DC converter and is supplied to the cooling fan.
11-2 Power Amp (PA PC1662) / L.P.F. (PC1681)

The RF PA is the heart of this amplifier and is composed of four SD2933 MOS FET's made by ST Micro, a French-Italian joint venture firm. The amplifier is a parallel push-pull type of class AB amplifier. The gate bias supply circuit is regulated for the best stability and is thermally compensated.

The PA has a 6dB attenuator on the input for gain reduction and to enhance the stability of the wide band power PA. The heat sink has two different thermal sensors to detect temperatures of 40 deg C, and 70 deg C, respectively. At 40 deg C, the cooling fan shifts into high-speed mode. At 70 deg C, the amplifier will lock the amplifier into RECEIVE mode to protect the power FET's.

In the L.P.F. (output low pass filter) circuit, there are eight different band filters that are selected either by the auto band decoder or by the manual band switch. Each L.P.F. is used to reject harmonics so that the amplifier meets international telecommunication equipment standards.
11-3 RF Power Detector/ TX-RX Switch (PC1667)

As illustrated below, there are two RF power detectors on this board. One detects the drive signal level from the radio and the other monitors the outgoing power and the reflected power from the load (antenna). These detected signals are sent to the MPU-PCS1699 Main Control board, which monitors the operating condition of the entire amplifier.

The TX-RX switch (Send-Receive switching) will switch the flow of drive power/output power and the incoming signal from the antenna with two high-speed relays mounted at the input and output sides of the PA. A two-channel antenna switch (A/B) is also installed on this main board.

The limiter on this board, together with the pre-scaler on PC1675, help the MPU on the Main Control to count the frequency of the RF drive signal.
This is the heart of the control signal processing for the HL-1.5KFX. It judges the operating condition of the amplifier, as well as issuing the commands to the peripheral circuits. Various analog signals are sent to the MPU such as RF drive from the transceiver, RF power signals at various points, DC power supply information, etc. These are converted to digital signals using a A/D converter. The MPU will then numerically compute the data, to determine the amplifier status, and issue commands for protections, as needed. Transmit-Receive switching, high/low control of fan, and which LED get lit are all performed by the MPU on this board.
11-5 Band Decoder/ Frequency Counter

The band decoder will decode the various operating band information as issued by the major brands of the radios (ICOM, Yaesu, Kenwood). Using the decoded signal, the amplifier will automatically determine the frequency band of the radio.

From these three manufacturers, there are four kinds of band data used in their latest radio models, i.e. DC voltage, 4-bit TTL, RS-232C, and serial data. The HL-1.5KFX is designed to be able to use any of these methods, when the matched cable is connected.

The MPU also performs a frequency counting function. The RF drive signal from the transceiver is sampled and divided by 16 (PC1675), this signal is then sent to the input of the MPU.

In the manual band select mode, if the frequency of the RF drive and band setting of the amplifier do not match each other, the MPU will send a band miss-set signal which will force an amplification “halt” command (shut down).

Additionally any RF measured between 26.0-28.0 MHz will immediately shut down amplifier operation.
12. Trouble Shooting

<table>
<thead>
<tr>
<th>Failure</th>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>AC mains not operating</td>
<td>① AC fuses blown</td>
<td>① Replace with new ones.</td>
</tr>
<tr>
<td></td>
<td>② AC cord not plugged in</td>
<td>② Plug in securely.</td>
</tr>
<tr>
<td></td>
<td>③ Interlock switch lifting</td>
<td>③ Screw bolts tightly on the top cover.</td>
</tr>
<tr>
<td></td>
<td>④ Wrong tap used on power transformer primary</td>
<td>④ Correct primary wiring.</td>
</tr>
<tr>
<td>Can't enter Transmit</td>
<td>① Remote control cable not connected</td>
<td>① Check the cable and connect properly.</td>
</tr>
<tr>
<td>mode</td>
<td>② Protection circuits on.</td>
<td>② Check drive power, antenna SWR, antenna selector A/B. Reset with AC POWER switch.</td>

</table>
APPENDIX

Auto Band Set Compatibility, Tokyo Hy-Power HL-1.5KFX

For Three Major Japanese Brand Radios

1. ICOM

A. ICOM CI-V

According to ICOM, any radio model manufactured in 1987 or thereafter is equipped with CI-V. Consequently most of ICOM’s owned by the users now work “Auto Band Set” through CI-V.

ICOM DC VOLTAGE BAND DATA

Following models are equipped with DIN sockets to supply HL-1.5KFX with DC voltage band data as well as CI-V.

IC-736, -746, -756, -756Pro, -756ProII, -756ProIII, -7400, -775DX II, -780, -7800

( IC-706MK II series, and -7000 need modification for DC VOLTAGE BAND DATA CABLE connector, See ICOM manual )

2. YAESU (Binary Coded Voltage)

FT-920, -1000D, -1000MP, -1000MP MKV, -2000, -DX9000

(FT-857D, -897D and -950 need modified special Yaesu Band Data Cable and/or Cable Adaptor. Contact HRO or Tokyo Hy-Power Head Office, Japan.)

3. KENWOOD (RS-232C Serial Data)

To our regret, there are only three models available that has RS-232C port. Kenwood says old popular models such as TS-950, -940 are not equipped with these features.

TS-870S, TS-480, TS-2000

(Some Kenwood owners may wish to use RS232C port for PC controlled logging purposes. In this case, the user will need a Y-shaped special 232C cable, that has two D-Sub plugs in parallel on one end (one for radio, and one for linear), and one D-Sub plug for PC, where the “TX” line is rather OPEN, and not closed to avoid the double hand shakings. For more details, contact THP.)

4. OTHERS (TEN-TEC)

Using the signal data converter, one may connect ORION to Yaesu socket of HL-1.5KFX. The converter IC (such as 74C147) will convert the nine band data of ORION (DC level) into binary codes. Then being polarity inverted through four 74C14 inverter IC, data is sent to 5-PIN DIN sockets of "YAESU". (For more details, please contact THP.)

For further questions, please contact the respective manufacturers’ USA service center, and/or THP Japan. THP believes above information is accurate and correct. However THP assumes no responsibility for any damage resulting from the connections of the equipments by the users.
