

SERVICE MANUAL

DUAL BAND FM TRANSCEIVER

IC-2410A
IC-2410E
IC-2410H

INTRODUCTION

This service manual describes the latest service information for the **IC-2410A/E/H** DUAL BAND FM TRANSCEIVER at the time of publication.

MODEL	VERSION NO.	VERSION	SYMBOL
IC-2410A	#05, #25	U.S.A.	USA
	#07, #27	Australia	AUS
	#08, #28	Asia	SEA
IC-2410E	#02, #22	Europe	EUR
	#03, #23	Italy	ITA
IC-2410H	#02, #22	Europe	EUR-H
	#03, #23	Italy	ITA-H
	#05, #25	U.S.A.	USA-H
	#07, #27	Australia	AUS-H
	#08, #28	Asia	SEA-H

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the DC power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

This picture shows the IC-2410H U.S.A. version.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110002200 IC MC3372MR IC-2410A/E/H MAIN-A UNIT 5 pieces
8810006230 Screw FH M2.6x4 ZK IC-2410A/E/H Top cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from the power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB~50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

GENERAL

- Frequency coverage

VERSION	VHF	UHF
U.S.A.	140.000~150.000*1 (Tx) 136.000~174.000*1 (Rx)	440.000~450.000
Italy	136.000~174.000*1	400.000~479.000*2
Europe	144.000~146.000	430.000~440.000
Australia	144.000~148.000	430.000~440.000
Asia	140.000~150.000*1 (Tx) 136.000~174.000*1 (Rx)	430.000~440.000

Unit: MHz

*1 Specifications guaranteed for 144.000~148.000 MHz.

*2 Specifications guaranteed for 430.000~440.000 MHz.

- Tuning step increments : 5, 10, 12.5, 15, 20, 25 kHz, 1 MHz or 10 MHz
- Number of memory channels

	VHF	UHF
Memory channels	15	15
Call channels	1	1
Scan edge channels	2	2

- Mode : FM (F3)
- Antenna impedance : 50 Ω nominal
- Power supply requirement : 13.8 V DC \pm 15 % (negative ground)
- Usable temperature range : $-10^{\circ}\text{C} \sim +60^{\circ}\text{C}$ ($+14^{\circ}\text{F} \sim +140^{\circ}\text{F}$)
- Dimensions : 140 (W) \times 40 (H) \times 174.5 (D) mm
5.5 (W) \times 1.6 (H) \times 6.9 (D) in
(projections not included)
- Weight : 1.35 kg (3.0 lb)

TRANSMITTER

- Modulation system : Variable reactance frequency modulation
- Max. frequency deviation : ± 5 kHz
- Spurious emissions : Less than -60 dB
- Microphone impedance : 600 Ω
- Output power and current drain (at 13.8 V DC)

		IC-2410A/E		IC-2410H	
		POWER	CURRENT	POWER	CURRENT
VHF	High	25 W	7.0 A	45 W	10.5 A
	Low 2	10 W	4.5 A	10 W	5.5 A
	Low 1	1 W	2.5 A	5 W	4.0 A
UHF	High	25 W	8.0 A	35 W	10.5 A
	Low 2	10 W	5.0 A	10 W	6.0 A
	Low 1	1 W	3.0 A	5 W	4.5 A

RECEIVER

- Receive system : Double-conversion superheterodyne
- Intermediate frequencies : 1st 17.2 MHz (VHF)
30.875 MHz (UHF)
2nd 455 kHz
- Sensitivity : Less than 0.16 μV for 12 dB SINAD
- Squelch threshold sensitivity : Less than 0.13 μV
- Selectivity : More than 15 kHz/ -6 dB
Less than 30 kHz/ -60 dB
- Spurious rejection ratio : More than 60 dB
- Audio output power : More than 2.4 W at 10 % distortion with an 8 Ω load
- Current drain : Max. audio output 1.8 A Squelched 1.2 A
- Audio output impedance : 4~8 Ω

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

• MAIN-A UNIT

• MAIN-B UNIT

* This picture shows the IC-2410A U.S.A. version

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 VHF ANTENNA SWITCHING CIRCUIT (MAIN-A UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received VHF signals enter the antenna connector on the MAIN-B UNIT and pass through a low-pass filter (C60, C64, C65, L11~L13) on the MAIN-A UNIT. When receiving, the antenna switching circuit (D9, D21, D22) turns OFF. The signals pass through a π -type low-pass filter (C117, C118, C120, L21, L22). The filtered signals are applied to the VHF RF circuit. The low-pass filter suppresses high harmonic components.

3-1-2 VHF RF CIRCUIT (MAIN-A AND MAIN-B UNITS)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the VHF antenna switching circuit pass through a RF switching diode (D19). When receiving one VHF frequency, 8 V from Q33 turn ON one side of D19. The VHF signals pass through a tuned bandpass filter (L20, C109, C110, C112, D17) and are applied to the RF amplifier (Q21).

When receiving two VHF frequencies simultaneously, 8 V from Q32 turn ON the other side of D19. The VHF signals are amplified at Q23, and then to RF amplifier (Q21) and MAIN-B UNIT through J1 respectively.

Amplified signals at Q21 are applied to a three-stage tuned bandpass filter (L17~L19, C97, C98, C100~C105, D14~D16) and are then applied to the VHF 1st mixer (Q19).

D14~D17 employ varactor diodes that track the bandpass filters and resonator circuits and are controlled by the VHF PLL lock voltage. The voltage is current-amplified at the DC amplifier circuit (Q4, Q5) and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

On the other hand, entered signals from J1 on the MAIN-B UNIT amplified at RF amplifier (Q37) and then applied to the VHF 1st mixer (Q36).

3-1-3 VHF 1st MIXER CIRCUIT (MAIN-A UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing a PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the VHF RF circuit are mixed at Q19 with a 1st LO signal coming from the VHF VCO circuit to produce a 17.2 MHz 1st IF signal.

• VHF RECEIVER BLOCK DIAGRAM

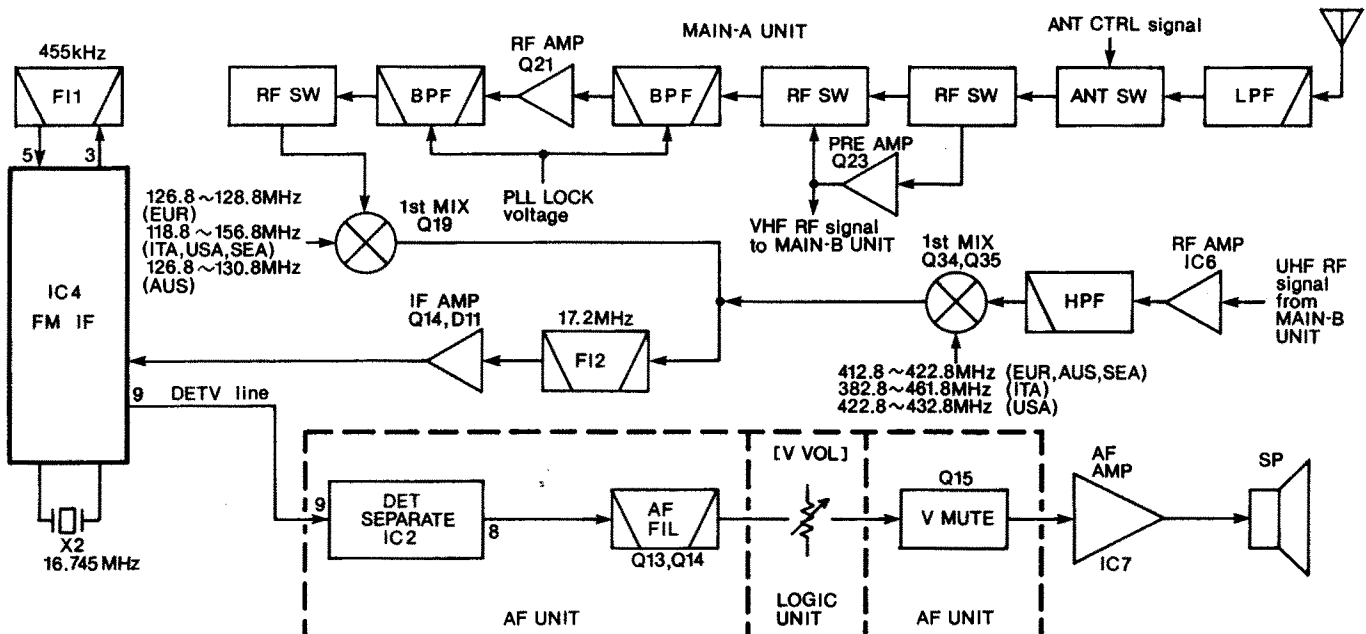

Fig. 1

3-1-4 VHF 1st IF CIRCUIT (MAIN-A UNIT)

The VHF 1st IF signal is applied to a matching circuit (L16, C93, C94). When receiving two UHF frequencies simultaneously, the UHF RF signals mixed at Q34 with a 1st LO signal coming from the VHF VCO circuit. The resulting 1st IF signal is applied to a pair of crystal filters (FI2) in order to obtain wide selection capability and to pass only the desired signals. The 1st IF signal passes through a matching circuit (L15, C88) and is then amplified at an IF amplifier (Q14). The amplified signal is applied to a demodulator circuit.

The limiter diode (D11) protects the following circuits from strong signals.

3-1-5 VHF 2nd IF AND DEMODULATOR CIRCUITS (MAIN-A UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from Q14 is applied to a 2nd mixer section of IC4 and is mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC4 contains the 2nd mixer, local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X2 generate 16.745 MHz for the 2nd LO signal.

The 2nd IF signal from the 2nd mixer (IC4, pin 3) passes through a high-quality ceramic filter (FI1) to suppress unwanted heterodyned frequency signals. It is then amplified at the limiter amplifier section (IC4, pin 5) and applied to the quadrature detector section (IC4, pin 5 and ceramic discriminator X1) to demodulate the 2nd IF signal into an AF signal.

The signal is output from IC4 (pin 9) as a "DETV" signal and then is applied to the AF UNIT.

3-1-6 VHF AF CIRCUIT (AF, LOGIC AND MAIN-A UNITS)

The AF circuit de-emphasizes demodulated the signal with -6 dB/octave and power-amplifies the signal to drive a speaker. The AF circuit includes a mute circuit to mute the signal with a noise squelch and a tone squelch.

The "DETV" signal from IC4 (pin 9) is applied to the IC switch (IC2) on the AF UNIT. IC3 controls the input level of IC2.

The AF signal from IC2 is applied to the active filter (Q13, Q14). The active filter (Q13, Q14) has frequency characteristics of -6 dB/octave and suppresses the tone signal for tone squelch operation.

The filtered signal is adjusted with the [V VOL] control (R23) on the LOGIC UNIT and is then amplified in the AF amplifier (IC7) on the MAIN-A UNIT to obtain the speaker driving level.

An AF mute transistor (Q15) cuts the input signals of the AF amplifier when the transceiver is transmitting or the squelch is closed.

3-1-7 VHF SQUELCH CIRCUIT (MAIN-A, AF AND LOGIC UNITS)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signal from IC4 (pin 9) are applied to an active filter section (IC4, pin 10) via a de-emphasis circuit (R68, C73~C75). This circuit is an integrated circuit with frequency characteristics of -6 dB/octave. The binary output from the CPU (IC3, pins 27 and 28) on the LOGIC UNIT supplies the squelch level volume control signal. This control signal is controlled by Q20 and Q21 on the AF UNIT. The squelch level setting volume control (R130) on the MAIN-A UNIT adjusts the IC4 (pin 10) input level.

The active filter section amplifies noise components of frequencies of 20 kHz and above, and outputs the resulting signals from pin 11. Output signals are rectified by D12 and are then converted to DC voltage.

The rectified noise voltage triggers the squelch switch (Q15). The collector of Q15 outputs the squelch signal. The signal is applied to IC3 (pin 18) on the LOGIC UNIT through the "SQLSV" signal line.

• VHF SQUELCH CIRCUIT

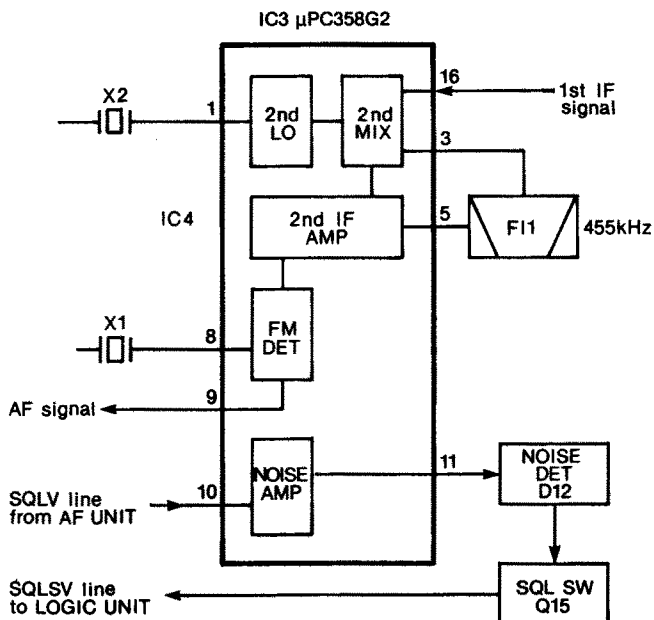

Fig. 2

3-1-8 UHF ANTENNA SWITCHING CIRCUIT (MAIN-B UNIT)

Received UHF signals enter the antenna connector and pass through a high-pass filter (C86~C88, L14, L15). When receiving, the antenna switching circuit (D9, D18, D19) turns OFF. The signals pass through a π -type low-pass filter (C82~85, C147, C148, C150, L12, L13, L25, L26). The filtered signals are applied to the UHF RF circuit.

3-1-9 UHF RF CIRCUIT (MAIN-A AND MAIN-B UNITS)

The signals from the UHF antenna switching circuit pass through an RF switching diode (D16). When receiving one UHF frequency, 8 V from Q34 turns ON one side of D16. The UHF signals pass through a tuned bandpass filter (L24, C139, C140) and are then applied to the RF amplifier (Q21). When receiving two UHF frequencies simultaneously, 8 V from Q33 turns ON the other side of D16. The UHF signals are amplified at Q22, and then to the RF amplifier (Q21) and MAIN-A UNIT through J1 respectively. Amplified signals are applied to the bandpass filter (L22) and are then amplified at Q20. The amplified signals pass through the bandpass filter (L21) and are then applied to the UHF 1st mixer (Q19).

The coils in the bandpass filters (L21, L22) employ a double tuned helical coil. They have good bandpass characteristics and eliminate signals outside of the range.

On the other hand, entered signals from J1 on the MAIN-A UNIT amplified at RF amplifier (IC6) and are applied to the UHF 1st mixer (Q34).

3-1-10 UHF 1st MIXER CIRCUIT (MAIN-B UNIT)

The signals from the UHF RF circuit are mixed at Q19 with a 1st LO signal coming from the UHF VCO circuit to produce a 30.850 MHz 1st IF signal.

3-1-11 UHF 1st IF CIRCUIT (MAIN-B UNIT)

The UHF 1st IF signal is applied to a matching circuit (L18, C124). When receiving two VHF frequencies simultaneously, the VHF RF signals are mixed at Q36 with a 1st LO signal coming from the UHF VCO circuit. The resulting 1st IF signal is applied to a pair of crystal filters (F12) in order to obtain wide selection capability and to pass only the desired signals. The 1st IF signal passes through a matching circuit (L17, C120) and is then amplified at an IF amplifier (Q16). The amplified signal is applied to a demodulator circuit.

The limiter diode (D12) protects the following circuits from strong signals.

3-1-12 UHF 2nd IF AND DEMODULATOR CIRCUITS (MAIN-B UNIT)

The 1st IF signal from Q16 is applied to a 2nd mixer section of IC4 and is mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC4 contains the 2nd mixer, local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X3 generate 30.395 MHz for the 2nd LO signal.

• UHF RECEIVER BLOCK DIAGRAM

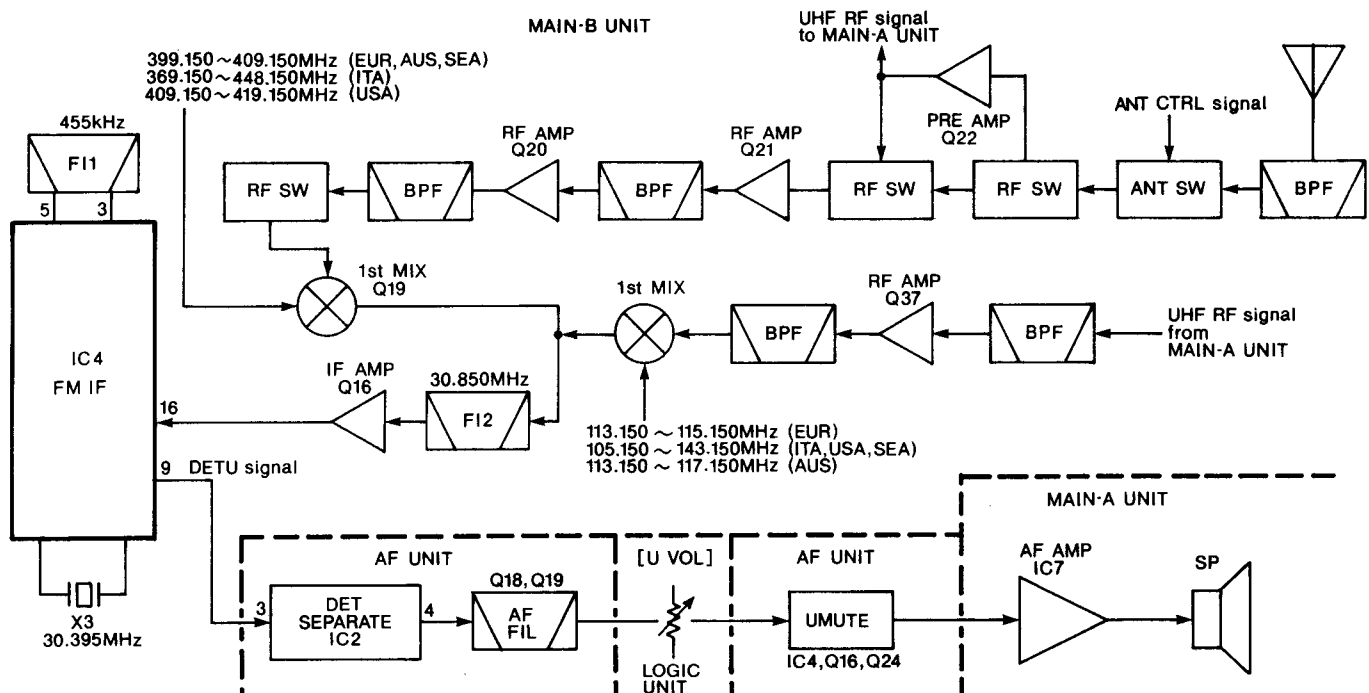

Fig. 3

The 2nd IF signal from the 2nd mixer (IC4, pin 3) passes through a high-quality ceramic filter (F11) to suppress unwanted heterodyned frequency signals. It is then amplified at the limiter amplifier section (IC4, pin 5) and applied to the quadrature detector section (IC4, pin 5 and ceramic discriminator X2) to demodulate the 2nd IF signal into an AF signal.

The signal is output from IC4 (pin 9) as a "DETU" signal and then is applied to the AF UNIT.

3-1-13 UHF AF CIRCUIT (MAIN-B, AF, LOGIC AND MAIN-A UNITS)

The "DETU" signal from IC4 (pin 9) is applied to the IC switch (IC2) on the AF UNIT. IC3 controls the input level of IC2.

The AF signal from IC2 is applied to the active filter (Q18, Q19). The active filter (Q18, Q19) has frequency characteristics of -6 dB/octave and suppresses the tone signal for tone squelch operation. The filtered signal is adjusted with the [U VOL] control (R24) on the LOGIC UNIT and is then amplified in the AF amplifier (IC7) on the MAIN-A UNIT to obtain the speaker driving level.

AF mute transistors (Q16, Q24) cut the input signals of the AF amplifier when the transceiver is transmitting or the squelch is closed.

3-1-14 UHF SQUELCH CIRCUIT (MAIN-B, AF AND LOGIC UNITS)

Some noise components in the AF signal from IC4 (pin 9) are applied to an active filter section (IC4, pin 10) via a de-emphasis circuit (R79, C101~C103). This circuit is an integrated circuit with frequency characteristics of -6 dB/octave.

The binary output from the CPU (IC3, pins 29 and 30) on the LOGIC UNIT supplies the squelch level volume control signal. This control signal is controlled by Q22 and Q23 on the AF UNIT. The squelch level setting volume control (R132) on the MAIN-B UNIT adjusts the IC4 (pin 10) input level.

The active filter section amplifies noise components of frequencies of 20 kHz and above, and outputs the resulting signals from pin 11. Output signals are rectified by D11 and are then converted to DC voltage.

The rectified noise voltage triggers the squelch switch (Q17). The collector of Q17 outputs the squelch signal. The signal is applied to IC3 (pin 19) on the LOGIC UNIT through the "SQLSU" signal line.

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER CIRCUIT (LOGIC AND AF UNITS)

The microphone amplifier circuit amplifies audio signals with $+6$ dB/octave pre-emphasis from the microphone to a level needed for the modulation circuit. The microphone amplifier circuit is commonly used for both VHF and UHF bands.

The AF signals from the microphone on the LOGIC UNIT are applied to the AF UNIT and are then amplified at the microphone amplifier circuit (Q6) via the microphone mute switch circuit (Q2). The amplified signals are applied to IC1a (pin 2) and are then pre-emphasized to $+6$ dB/octave through C18 and R28 which are connected to pin 3. IC1a includes a low level amplifier with pre-emphasis and a limiter amplifier. The output signals from IC1a (pin 1) pass through a low-pass filter circuit (IC1b). The filtered signals are applied to either the MAIN-A UNIT as a "MODV" signal in the VHF band or the MAIN-B UNIT as a "MODU" signal in the UHF band.

• VHF TRANSMITTER BLOCK DIAGRAM

Fig. 4

3-2-2 VHF MODULATION CIRCUIT (VCO-A UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The audio signals from the AF UNIT (MODV signal) pass through the IC switch (IC1) and are then applied to the varactor diodes (D1~D4) to modulate the oscillated signals in the VHF VCO circuit. The VHF VCO circuit contains both the V-UHF VCO oscillator (Q1) and the V-VHF VCO oscillator (Q4). The oscillated signals are mixed together and then buffer-amplified at Q3. The amplified signals are applied to Q5 on the PLL-A UNIT through the "VCOOA" signal line. The resulting signals are output from the "LOOA" signal line and are then applied to the drive amplifier circuit.

3-2-3 VHF DRIVE AMPLIFIER CIRCUIT (MAIN-A UNIT)

The VCO output is buffer-amplified at Q6 and is then applied to a low-pass filter (C21, C22, C25, C28, L2, L5).

After passing through the transmit/receive switching circuit (D4), the VCO output is amplified at the drive amplifier (Q8) to obtain 200 mW (IC-2410H: 400 mW).

The control voltage from the APC circuit is applied to the collector of Q8 for stable RF output power from a power amplifier (IC2).

3-2-4 VHF POWER AMPLIFIER CIRCUIT (MAIN-A UNIT)

IC2 is a power module which provides a stable 25 W (IC-2410H: 45 W) of output power.

The RF signal from the drive amplifier (Q8) is applied to IC2 (pin 4). The amplified signal is output from IC2 (pin 1) and is then applied to the antenna connector through the antenna switching diode (D9) and low-pass filter circuit (C60, C64, C65, L11~L13).

3-2-5 VHF APC CIRCUIT (MAIN-A UNIT)

This circuit controls current in the power module's first stage and current in the driver amplifier to obtain stable RF output power.

The APC mismatch detector circuit consists of C49, C53, D7, D8, L9, R42, R43, R46 and R47. When the antenna impedance is matched at 50 Ω , the detected voltage by D7 and D8 is at its minimum. The detected voltage is applied to an APC amplifier (IC3b, pin 6) and an RF meter amplifier (IC3a, pin 3). The RF meter amplifier outputs RF meter voltage. The APC reference voltage is applied to pin 5 of IC3b.

When the antenna impedance is mismatched, the voltage of IC3b (pin 6) exceeds the reference voltage of IC3b (pin 5). The output level from IC3b (pin 7) decreases. Q12 amplifies the current from the APC amplifier (IC3b) which controls Q11. Q11 changes the supply voltage to Q8 and IC2.

This decreases the output power from the drive amplifier (Q8) and power amplifier (IC2) until the input voltage of IC3b (pin 6) reaches the same level as pin 5 of IC3b.

3-2-6 VHF OUTPUT POWER CONTROL CIRCUIT (MAIN-A UNIT)

The output power control circuit (Q9, Q10, R30~R32, R37, R39) selects 1 of 3 output power levels (HIGH, LOW-2 or LOW-1) and controls the output voltage from the APC circuit by the APC reference voltage.

When "HIGH" output power is selected, Q9 and Q10 are turned OFF. The APC reference voltage is determined by R30~R32 and is adjusted with R31.

When "LOW-2" output power is selected, Q10 is turned ON. The reference voltage is decreased by R39 connected to Q10.

When "LOW-1" output power is selected, Q9 is turned ON. The reference voltage is decreased by R37 connected to Q9.

• VHF POWER AND APC CIRCUIT

Fig. 5

3-2-7 VHF ANTENNA SWITCHING CIRCUIT (MAIN-A UNIT)

When transmitting, D9, D21 and D22 are turned ON. The RF output signal from IC2 is not permitted to enter the receiver circuit. The signal passes through L9, C55, D9 and a low-pass filter (C60, C64, C65, L11~L13) and is then output from an antenna connector. The low-pass filter suppresses high harmonic components.

3-2-8 UHF MODULATION CIRCUIT (VCO-B UNIT)

The audio signals from the AF UNIT (MODU signal) pass through the IC switch (IC1) and are then applied to the varactor diodes (D1~D4) to modulate the oscillated signals in the UHF VCO circuit. The UHF VCO circuit contains both the U-UHF VCO oscillator (Q1) and the U-VHF VCO oscillator (Q4). The oscillated signals are mixed together and then buffer-amplified at Q3. The amplified signals are applied to Q5 on the PLL-B UNIT through the "VCOOB" signal line. The resulting signals are output from the "LOOB" signal line and are then applied to the drive amplifier circuit.

3-2-9 UHF DRIVE AMPLIFIER CIRCUIT (MAIN-B UNIT)

The VCO output is buffer-amplified at Q8 and is then applied to a low-pass filter (C37~C39, L2).

After passing through the transmit/receive switching circuit (D4), the VCO output is amplified at the pre-drive amplifier (Q10). The amplified signal is re-amplified at the drive amplifier (Q11) to obtain 320 mW (IC-2410H: 500 mW).

The control voltage from the APC circuit is applied to the collector of Q11 for stable RF output power from a power amplifier (IC2).

3-2-10 UHF POWER AMPLIFIER CIRCUIT (MAIN-B UNIT)

IC2 is a power module which provides a stable 25 W (IC-2410H: 35 W) of output power.

The RF signal from the drive amplifier (Q11) is applied to IC2 (pin 1). The amplified signal is output from IC2 (pin 5) and is then applied to the antenna connector through the antenna switching diode (D9) and bandpass filter circuit (C83~C88, L12~L15).

• UHF TRANSMITTER BLOCK DIAGRAM

Fig. 6

3-2-11 UHF APC CIRCUIT (MAIN-B UNIT)

The APC mismatch detector circuit consists of C72, C75, D7, D8, L10, R53, R54, R60 and R61. When the antenna impedance is matched at 50 Ω , the detected voltage by D7 and D8 is at its minimum. The detected voltage is applied to an APC amplifier (IC3b, pin 6) and an RF meter amplifier (IC3a, pin 3). The RF meter amplifier outputs RF meter voltage. The APC reference voltage is applied to pin 5 of IC3b.

When the antenna impedance is mismatched, the voltage of IC3b (pin 6) exceeds the reference voltage of IC3b (pin 5). The output level from IC3b (pin 7) decreases. Q15 amplifies the current from the APC amplifier (IC3b) which controls Q14. Q14 changes the supply voltage to Q11 and IC2.

This decreases the output power from the drive amplifier (Q11) and power amplifier (IC2) until the input voltage of IC3b (pin 6) reaches the same level as pin 5 of IC3b.

3-2-12 VHF OUTPUT POWER CONTROL CIRCUIT (MAIN-B UNIT)

The output power control circuit (Q12, Q13, R46~R49) selects 1 of 3 output power levels (HIGH, LOW-2 or LOW-1) and controls the output voltage from the APC circuit by the APC reference voltage.

When "HIGH" output power is selected, Q12 and Q13 are turned OFF. The APC reference voltage is determined by R46, R47 and is adjusted with R47.

When "LOW-2" output power is selected, Q13 is turned ON. The reference voltage is decreased by R49 connected to Q13.

When "LOW-1" output power is selected, Q12 is turned ON. The reference voltage is decreased by R48 connected to Q12.

• UHF OUTPUT POWER CONTROL CIRCUIT

	Q12	Q13
HIGH	OFF	OFF
LOW2 (LPO-2)	OFF	ON
LOW1 (LPO-1)	ON	OFF

Fig. 7

3-2-13 UHF ANTENNA SWITCHING CIRCUIT (MAIN-B UNIT)

When transmitting, D9, D18 and D19 are turned ON. The RF output signal from IC2 is not permitted to enter the receiver circuit. The signal passes through L10, C78, D9 and a bandpass filter (C83~ C88, L12~L15) and is then output from an antenna connector.

3-3 PLL CIRCUITS

3-3-1 GENERAL

A PLL circuit steadily oscillates the transmit frequency and the receiver 1st LO frequency. The PLL circuit compares phases of the divided VCO frequency and reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

3-3-2 REFERENCE OSCILLATOR CIRCUIT (MAIN-B UNIT)

A 12.8 MHz reference frequency is determined by the oscillator (X1) and is then oscillated by a Colpitts oscillator circuit (Q3). The frequency is adjusted with C6. The reference frequency is buffer-amplified at Q4 and is then applied to both VHF and UHF PLL circuits.

3-3-3 VHF VCO CIRCUIT (VCO-A UNIT)

The VHF VCO circuit contains both V-UHF and V-VHF VCO circuits to obtain a 120 MHz~420 MHz oscillation for the VHF PLL circuit. This circuit is newly designed to receive two frequencies in the same band.

The V-UHF VCO circuit employs a Colpitts oscillator circuit (Q1). The output signal from the V-UHF VCO circuit is mixed with the V-VHF VCO oscillation via C10 and R9.

The V-VHF VCO circuits employs a Hartley oscillator circuit (Q4). The output signal from the V-VHF VCO circuit is mixed with the V-UHF VCO oscillation via C22 and R19.

Varactor diodes (D1~D4) provide frequency control. The buffer amplifier (Q3) amplifies VCO oscillation and does not permit the latter circuit to affect the VCO oscillation.

Pin 7 of IC1 on the PLL-A UNIT controls Q4 to activate either the V-VHF or the V-UHF VCO circuit.

3-3-4 VHF PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (PLL-A UNIT)

The programmable divider shifts the dividing ratio with a prescaler depending on the operating frequency and determines the VCO oscillating frequency.

The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

The output signal from the VCO-A UNIT enters PLL IC (IC1, pin 5) or a buffer amplifier (Q5) on the PLL-A UNIT.

IC1 is a one-chip PLL IC that contains a two-modulus prescaler, a pulse counter, a programmable divider and a phase detector.

The input signal from the PLL IC (IC1, pin 5) passes through the two-modulus prescaler and the programmable divider sections of IC1. A 12.8 MHz reference frequency from X1 on the MAIN-B UNIT is applied to IC1 (pin 15) and passes through a reference programmable divider section of IC1. Both of the divided signals are compared at a phase detector section of IC1. The phase-detected signal (pulse signal) is output from IC1 (pin 12).

3-3-5 VHF LOOP FILTER AND DC-DC-CONVERTER CIRCUITS (PLL-A AND MAIN-A UNITS)

Phase-detected signal (pulse signal) from IC1 (pin 12) is converted to DC voltage (PLL lock voltage) by a loop filter consisting of an active filter (Q1, Q2).

The VHF VCO oscillation on the VCO-A UNIT is controlled by varactor diodes (D1~D4). DC voltage (PLL lock voltage) is provided through the integrator circuit (C4, R5) and is then applied to a DC amplifier circuit (Q4, Q5). The voltage is used as the tuning voltage for the receiver bandpass filters.

30 V DC from the DC-DC converter circuit (IC8, Q40, Q41) on the MAIN-B UNIT is applied to the loop filter. The voltage is used to obtain a wide range of lock voltage for the PLL circuit.

3-3-6 VHF UNLOCK SENSOR CIRCUIT (PLL-A AND LOGIC UNITS)

When the PLL circuit is unlocked, IC1 (pin 13) becomes "HIGH". The "HIGH" signal is applied to the CPU (IC3, pin 20) as an unlock signal on the LOGIC UNIT.

• VHF PLL-A AND VCO-A BLOCK DIAGRAM

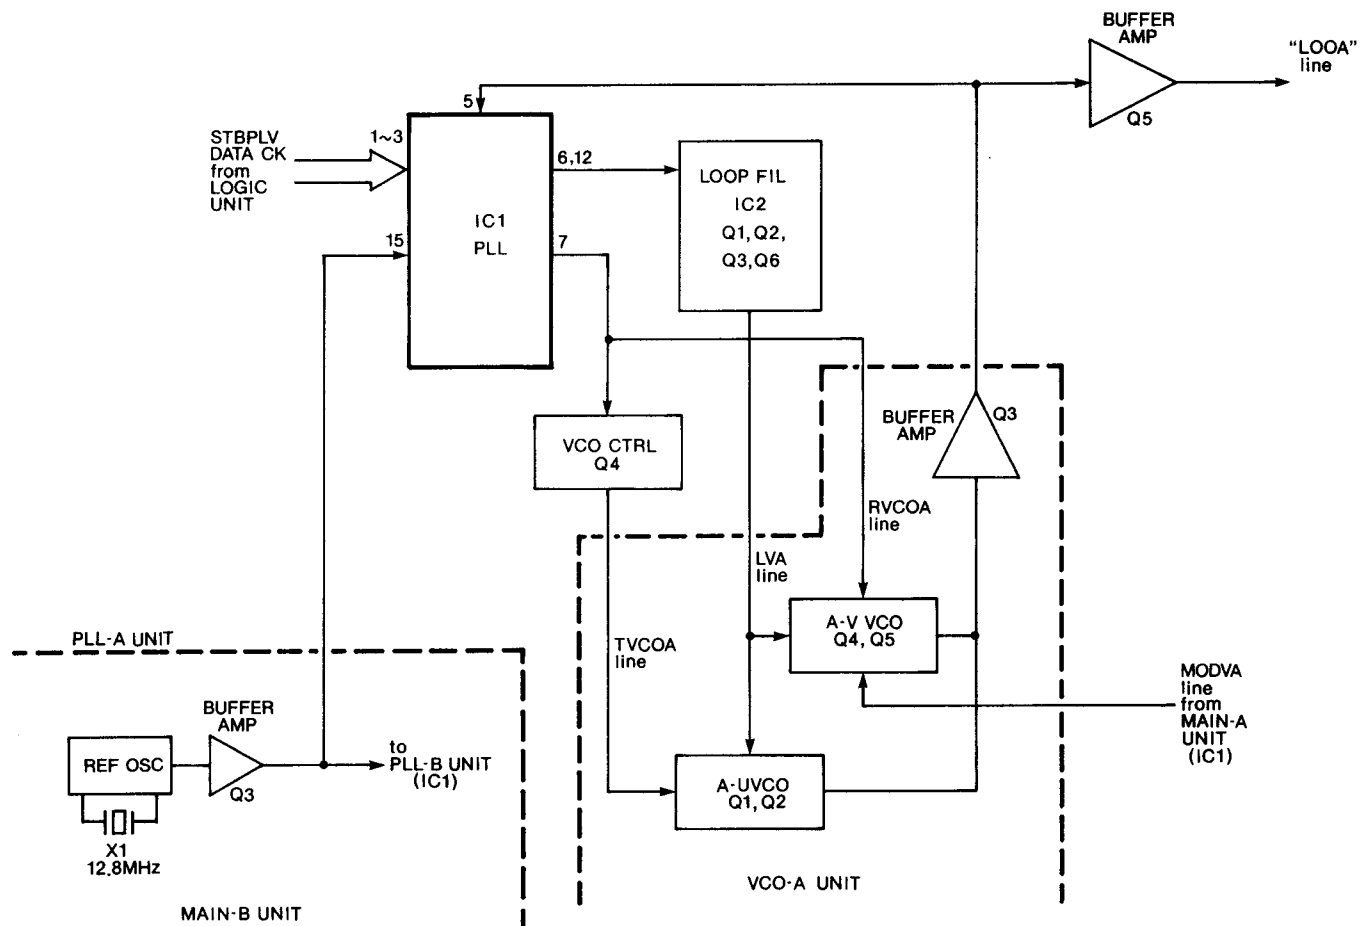

Fig. 8

3-3-7 UHF VCO CIRCUIT (VCO-B UNIT)

The UHF VCO circuit contains both U-UHF and U-VHF VCO circuits to obtain a 120 MHz~420 MHz oscillation for the UHF PLL circuit. This circuit is newly designed to receive two frequencies in the same band.

The U-UHF VCO circuit employs a Colpitts oscillator circuit (Q1). The output signal from the U-UHF VCO circuit is mixed with the U-VHF VCO oscillation via C10 and R9.

The U-VHF VCO circuit employs a Hartley oscillator circuit (Q4). The output signal from the U-VHF VCO circuit is mixed with the U-UHF VCO oscillation via C22 and R19.

Varactor diodes (D1~D4) provide frequency control. The buffer amplifier (Q3) amplifies VCO oscillation and does not permit the latter circuit to affect the VCO oscillation.

Pin 7 of IC1 on the PLL-B UNIT controls Q4 to activate either the U-VHF or the U-UHF VCO circuit.

3-3-8 UHF PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (PLL-B UNIT)

The programmable divider shifts the dividing ratio with a prescaler depending on the operating frequency and determines the VCO oscillating frequency.

The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

The output signal from the VCO-B UNIT enters either PLL IC (IC1, pin 5) or a buffer amplifier (Q5) on the PLL-B UNIT.

IC1 is a one-chip PLL IC that contains a two-modulus prescaler, a pulse counter, a programmable divider and a phase detector.

The input signal from the PLL IC (IC1, pin 5) passes through the two-modulus prescaler and the programmable divider sections of IC1. A 12.8 MHz reference frequency from X1 is applied to IC1 (pin 15) and passes through a programmable divider section of IC1. Both of the divided signals are compared at a phase detector section of IC1. The phase-detected signal (pulse signal) is output from IC1 (pin 12).

3-3-9 UHF LOOP FILTER AND DC-DC-CONVERTER CIRCUITS (PLL-B AND MAIN-B UNITS)

Phase-detected signals (pulse signals) from IC1 (pin 12) are converted to DC voltage (PLL lock voltage) by a loop filter consisting of an active filter (Q1, Q2).

The UHF VCO oscillation on the VCO-B UNIT is controlled by varactor diodes (D1~D4). DC voltage (PLL lock voltage) is provided through the integrator circuit (C4, R5) and is then applied to a DC amplifier circuit (Q6, Q7). The voltage is used as the tuning voltage for the receiver bandpass filters.

30 V DC from the DC-DC converter circuit (IC8, Q40, Q41) is applied to a 24 V regulator (D1) to obtain a stable 24 V DC. The voltage is used at the loop filter to obtain a wide range of lock voltage for the PLL circuit.

3-3-10 UHF UNLOCK SENSOR CIRCUIT (PLL-B AND LOGIC UNITS)

When the PLL circuit is unlocked, IC1 (pin 13) becomes "HIGH". The "HIGH" signal is applied to the CPU (IC3, pin 21) as an unlock signal on the LOGIC UNIT.

• UHF PLL-B UNIT BLOCK DIAGRAM

Fig. 9

3-4 OTHER CIRCUITS

3-4-1 VHF S/RF INDICATOR CIRCUIT (MAIN-A AND LOGIC UNITS)

The RF meter voltage from IC3a (pin 1) is rectified at an S/RF meter detector (D24). The detected voltage is output as the "SRFV" signal. The signal is applied to an S/RF comparator (IC4b, pin 5) on the LOGIC UNIT.

IC4b (pin 6) receives an S/RF indicator reference signal from the CPU (IC3, pins 4~7) using the D/A converter (R43~R46). These pins increase the reference signal level.

When the reference signal becomes greater than the "SRFV" signal, IC4b (pin 7) becomes "LOW". The CPU detects the signal strength level using the outputs from IC3 (pins 4~7) and indicates the signal strength level on the FUNCTION DISPLAY when receiving the "LOW" signal.

3-4-2 UHF S/RF INDICATOR CIRCUIT (MAIN-B AND LOGIC UNITS)

The RF meter voltage from IC3a (pin 1) is rectified at an S/RF meter detector (D21). The detected voltage is output as the "SRFU" signal. The signal is applied to an S/RF comparator (IC4a, pin 3) on the LOGIC UNIT.

IC4b (pin 2) receives an S/RF indicator reference signal from the CPU (IC3, pins 4~7) using the D/A converter (R43~R46). These pins increase the reference signal level.

When the reference signal becomes greater than the "SRFU" signal, IC4a (pin 1) becomes "LOW". The CPU detects the signal strength level using the outputs from IC3 (pins 4~7) and indicates the signal strength level on the FUNCTION DISPLAY when receiving the "LOW" signal.

3-4-3 CPU POWER SUPPLY CIRCUIT (LOGIC UNITS)

When the power switch is turned OFF, voltage is applied to the CPU (IC3, pin 26) via D3 from the lithium backup battery installed on the LOGIC UNIT to provide backup power for the memory contents.

3-4-4 CPU RESET CIRCUIT (LOGIC UNIT)

This circuit resets the CPU with a three-terminal voltage regulator IC (IC2). IC2 detects +5 V when the DC voltage is applied to the input terminal of IC2 and outputs 5V. When the 5 V line becomes higher than the threshold voltage of IC2, the CPU reset circuit outputs "HIGH" as the interrupt signal.

When the [POWER] switch is turned ON, the RESET port of the CPU (IC3, pin 43) becomes "HIGH". When the port receives "HIGH", the CPU restarts operation. The time constant (C14, R27, R28) provides sufficient reset time.

When the 5 V line becomes lower than the threshold voltage of IC2, the INT1 port of the CPU (IC3, pin 17) becomes "LOW", and the CPU enters the backup condition.

• CPU RESET CIRCUIT

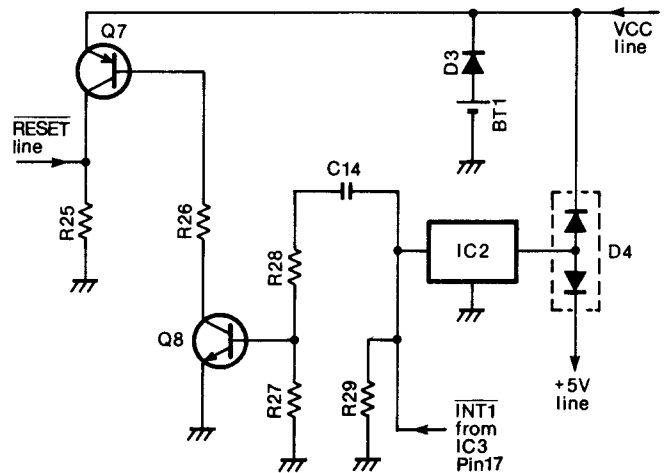

Fig. 10

3-4-5 DIMMER CIRCUIT (LOGIC UNIT)

The dimmer circuit consists of Q9~Q11 and other components and drives backlights (DS1~DS5), ensuring that brightness does not change even with a change of power supply.

The brightness of the FUNCTION DISPLAY is set at 1 of 5 levels using combinations of output levels in IC3 (pins 24 and 25). When the CPU (IC3, pins 24 and 25) changes its output level, Q11 changes the base voltage and the collector current of Q9 and Q10 changes. Therefore, the collector voltage is changed and the brightness of lamps DS1~DS5 changes.

• DIMMER CIRCUIT

Fig. 11

3-4-6 REGULATOR CIRCUIT (MAIN-B UNIT)

IC9 is a 3-terminal voltage regulator IC chip. +13.8 V is applied to the input terminal. The output terminal outputs a regulated +9 V (+8 V line) to each unit.

Q38, Q39 and D29 produce a regulated 8 V (+8 V line) for the MAIN-A UNIT. This regulator is composed of a complementary connection to ensure high current amplification and supplies stable output voltage continuously with good temperature characteristics.

IC7 is a 3-terminal voltage regulator IC chip. +13.8 V is applied to the input terminal. The output terminal outputs a regulated +5.5 V (5 V line) using D28.

D1 produces a regulated 24 V for the UHF loop filter circuit. This voltage is converted from 30 V DC which is produced by the DC-DC converter (IC8, Q40, Q41).

3-5 CPU PORT ALLOCATIONS (LOGIC UNIT)

• IC3 CPU

PORT No.	PIN No.	TERMINAL NAME	DESCRIPTION
D0	48	T SQLV	Detects a VHF tone squelch signal. When the signal is "HIGH", an optional tone squelch opens.
D1	49	T SQLU	Detects a UHF tone squelch signal. When the signal is "HIGH", an optional tone squelch opens.
D2	50	UNIT. T	Becomes "LOW" when an optional UT-67 TONE SQUELCH UNIT is connected.
D3	51	STB VC	Outputs a strobe signal for VHF control.
D4	52	STB UC	Outputs a strobe signal for UHF control.
D5	53	STB AC	Outputs a strobe signal for common control.
D6	54	STB PLV	Outputs a strobe signal for VHF PLL data on the MAIN-A UNIT.
D7	55	STB PLU	Outputs a strobe signal for UHF PLL data on the MAIN-B UNIT.
D8	56	MIC CK	Input port for the microphone clock.
D9	57	MIC U/D	Input port for the microphone up/down signal.
D10	58	PTT	Inputs a signal on the PTT line. This port becomes "HIGH" when the PTT switch is pushed.
D11	59	BEEP	Outputs a signal for beep tone.
D12	60	S TONE	Outputs a signal for 88.5 Hz tone.
D13	61	LINH	Outputs a control signal for LCD on the DISPLAY UNIT.
D14	62	LCE1	Outputs a signal for LCD driver (IC1) on the DISPLAY UNIT.
D15	63	LCE2	Outputs a signal for LCD driver (IC2) on the DISPLAY UNIT.
R00	64	LDATA	Outputs serial data for LCD.

PORT No.	PIN No.	TERMINAL NAME	DESCRIPTION															
R01	1	LCK	Outputs clock signals for LCD.															
R02~R03, R10	2~4	INI S0~INI S2	Output strobe signals for the initial matrix.															
R11~R13	5~7	SRF 01~SRF 03	Output counting signals for the S/R F INDICATOR.															
R20~R23	8~11	KEY I0~KEY I3	Input ports for the key and initial matrix.															
R30	14	DIAL UP	Input port for the up signal of the TUNING CONTROL.															
R31	15	DIAL DN	Input port for the down signal of the TUNING CONTROL.															
R32	16	INT0/ DIAL CK	Input port for the up/down clock signal of the TUNING CONTROL.															
R33	17	INT1/ BACKUP	Input port for the signal of memory backup.															
R40~R41	27~28	V SQL1~V SQL2	Output control signals for VHF squelch level setting.															
R42~R43	29~30	U SQL1~U SQL2	Output control signals for UHF squelch level setting.															
R50	18	SQLS V	Detects a VHF squelch signal. When the signal is "HIGH", the VHF squelch opens.															
R51	19	SQLS U	Detects a UHF squelch signal. When the signal is "HIGH", the UHF squelch opens.															
R52	20	UNLK V	Detects a VHF PLL unlock signal. When the signal is "HIGH", the VHF PLL is unlocked. Normally, this port is "LOW".															
R53	21	UNLK U	Detects a UHF PLL unlock signal. When the signal is "HIGH", the UHF PLL is unlocked. Normally, this port is "LOW".															
R60	22	CK	Outputs a clock signal for the serial data (DATA).															
R61	23	DATA	Outputs serial data.															
R62~R63	24~25	DIM0~DIM1	For setting the LCD dimmer. Level 3 is the brightest. <table border="1" style="margin-left: 20px;"> <tr> <td>Level</td> <td>0</td> <td>1</td> <td>2</td> <td>3</td> </tr> <tr> <td>DIM0</td> <td>L</td> <td>H</td> <td>L</td> <td>H</td> </tr> <tr> <td>DIM1</td> <td>L</td> <td>L</td> <td>H</td> <td>H</td> </tr> </table>	Level	0	1	2	3	DIM0	L	H	L	H	DIM1	L	L	H	H
Level	0	1	2	3														
DIM0	L	H	L	H														
DIM1	L	L	H	H														
R70	31	STB TV	Outputs a strobe signal for an optional UT-67 TONE SQUELCH UNIT control on the VHF band.															
R71	32	STB TU	Outputs a strobe signal for an optional UT-67 TONE SQUELCH UNIT control on the UHF band.															
R72	33	STB DT	Outputs a strobe signal for an optional UT-55 DTMF ENCODER/ DECODER UNIT control.															
R73	34	STB SP	Outputs a strobe signal for an optional UT-66 VOICE SYNTHESIZER UNIT control.															
R81	36	UNIT. S	Becomes "LOW" when an optional UT-66 VOICE SYNTHESIZER UNIT is connected.															
R82	37	UNIT. T	Becomes "LOW" when an optional UT-55 DTMF ENCODER/ DECODER UNIT is connected.															

PORT No.	PIN No.	TERMINAL NAME	DESCRIPTION
R83	38	STD	Becomes "HIGH" while DTMF is decoding.
R90~ R93	39~ 42	D0~ D3	DTMF decode data (4 bits).
RA0	12	V SRFI	Inputs a resulting signal from the S/RF meter comparator on the VHF band.
RA1	13	U SRFI	Inputs a resulting signal from the S/RF meter comparator on the UHF band.
RESET	43	RESET INPUT	When a "HIGH" signal is applied to this port, either the CPU is initialized or changes to stand-by mode.
OSC1	45		Input port for the oscillator of the CPU clock.
OSC2	46		Output port for the oscillator of the CPU clock.
GND	47		Ground
VCC	26		Input port for the power source of the CPU.

SECTION 6 ADJUSTMENT PROCEDURES

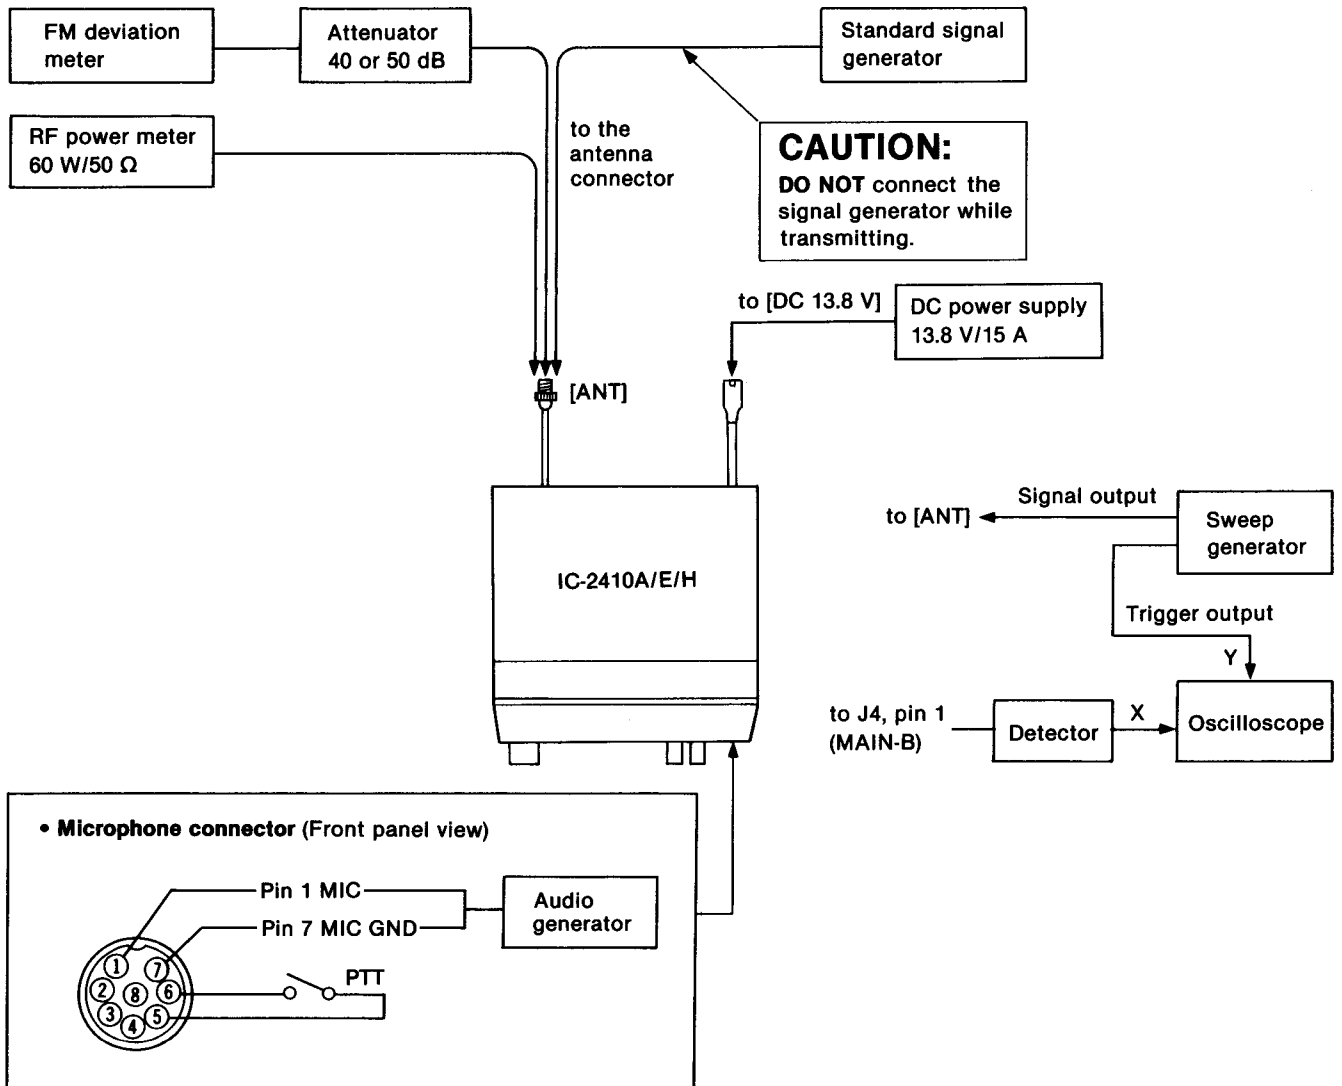

6-1 PREPARATION BEFORE SERVICING

REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 15 A or more	Audio generator	Frequency range : 300~3000 Hz Output level : 1~500 mV
RF power meter (terminated type)	Measuring range : 1~60 W Frequency range : 120~460 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Attenuator	Power attenuation : 40 or 50 dB Capacity : 60 W or more
Frequency counter	Frequency range : 0.1~460 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Sweep generator	Frequency range : 0.1~460 MHz Sweep bandwidth : At least 10 MHz Output impedance : 50 Ω
Oscilloscope	Frequency range : DC~20 MHz Measuring range : 0.01~10 V	Detector	
Standard signal generator (SSG)	Frequency range : 0.1~460 MHz Output level : -127~-17 dBm (0.1 μV~32 mV)		
DC voltmeter	Input impedance : 50 kΩ/DC or better		

CW: Clockwise CCW: Counterclockwise CP: Check point

CONNECTION
