FT-920
Technical Supplement

This manual provides technical information necessary for servicing the Yaesu FT-920 HF & 50-MHz-Band transceiver. It does not include information on installation and operation, which are described in the FT-920 Operating Manual provided with the transceiver, or on accessories which are described in their manuals.

The FT-920 is carefully designed to allow the knowledgeable operator to make nearly all adjustments required for various station conditions, modes and operator preferences simply from the controls on the panels, without opening the case of the transceiver. The FT-920 Operating Manual describes these adjustments, plus certain internal settings.

Servicing this equipment requires expertise in handling surface mount chip components. Attempts by unqualified persons to service this equipment may result in permanent damage not

covered by warranty. For the major circuit boards, each side of the board is identified by the type of the majority of components installed on that side. In most cases one side has only chip components, and the other has either a mixture of both chip and lead components (trimmers, coils, electrolytic capacitors, packaged ICs, etc.), or lead components only.

While we believe the technical information in this manual is correct, Yaesu assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated. Yaesu Musen reserves the right to make changes in this transceiver and the alignment procedures, in the interest of technological improvement, without notification of owners.

Chip Component Information

Replacing Chip Components

Chip components are installed at the factory by a series of robots. The first one places a small spot of adhesive resin at the location where each part is to be installed, and later robots handle and place parts using vacuum suction.

For single sided boards, solder paste is applied and the board is then baked to harden the resin and flow the solder. For double sided boards, no solder paste is applied, but the board is baked (or exposed to ultra-violet light) to cure the resin before dip soldering.

In our laboratories and service shops, small quantities of chip components are mounted manually by applying a spot of resin, placing with tweezers, and then soldering by very small dual streams of hot air (without physical contact during soldering). We remove parts by first removing solder using a vacuum suction iron, which applies a light steady vacuum at the iron tip, and then breaking the adhesive with tweezers.

The special vacuum/desoldering equipment is recommended if you expect to do a lot of chip replacements. Otherwise, it is usually possible to remove and replace chip components with only a tapered, temperature-controlled soldering iron, a set of tweezers and braided copper solder wick. Soldering iron temperature should be below 280°C (536°F).

Precautions for Chip Replacement

- Do not disconnect a chip forcefully, or the foil pattern may peel off the board.
- Never re-use a chip component. Dispose of all removed chip components immediately to avoid mixing with new parts.
- Limit soldering time to 3 seconds or less to avoid damaging the component and board.

Removing Chip Components

- Remove the solder at each joint, one joint at a time, using solder wick whetted with non-acidic fluxes as shown below. Avoid applying pressure, and do not attempt to remove tinning from the chip's electrode.

- Grasp the chip on both sides with tweezers, and gently twist the tweezers back and forth (to break the adhesive bond) while alternately heating each electrode. Be careful to avoid peeling the foil traces from the board. Dispose of the chip when removed.
- After removing the chip, use the copper braid and soldering iron to wick away any excess solder and smooth the land for installation of the replacement part.

Chip Component Information

Installing a Replacement Chip

As the value of some chip components is not indicated on the body of the chip, be careful to get the right part for replacement.

- Apply a small amount of solder to the land on one side where the chip is to be installed. Avoid too much solder, which may cause bridging (shorting to other parts).

- Hold the chip with tweezers in the desired position, and apply the soldering iron with a motion line as indicated by the arrow in the diagram below. Do not apply heat for more than 3 seconds.

- Remove the tweezers and solder the electrode on the other side in the manner just described.

Transceiver Disassembly & PCB Unit Access

Disassembly Tips

The FT-920 uses over 15 individual unit/assemblies, interconnected for maximum performance and compactness. With the exception of routine installations (filters, options, backup battery replacement, etc.), we do not recommend further disassembly. Circuit repair and alignment require familiarity with complex analog and digital circuitry, and access to the specialized test equipment needed for circuit analysis. Therefore, we recommend repairs be conducted by at an authorized repair facility via the Yaesu dealer where the unit was purchased.

When proceeding with transceiver disassembly, keep the following items in mind -

- ❑ Various types of screws sizes and thread pitch are used - separate screws and keep them with the unit they were removed from.
- ❑ When unplugging wiring connectors or mini coax cables, make note of any color coding to facilitate easy identification during reassembly.

Top Cover Removal

- ❑ Turn the transceiver off, and disconnect all cables. Remove the 9 screws affixing the top cover, then tilt and pull the cover off.

- ❑ Remove the 12 screws affixing the top plate (with speaker). Tilt the plate and disconnect the speaker cable, then pull the cover off. This exposes the PA, REG and Tuner-CNTL Units.

- ❑ Disconnect J9004, J9005 on the REG Unit and 2 connectors to the motor on the Tuner-Main Unit.

- ❑ Remove the 7 screws on the shield plate, and 4 screws on the Tuner-CNTL Unit. Then tilt and pull the plate off. This expose the Tuner-Main Unit.

Transceiver Disassembly & PCB Unit Access

Bottom Cover Removal

- Loosen the 4 screws on each side of the top panel, and remove the 6 screws affixing the bottom cover, then tilt and pull the bottom cover off. This exposes the MAIN and DSP Units.

- Remove the 3 screws near DSP Unit, and lift the DSP Unit (be careful not to break the wires, nor to bend the connector pins under the DSP Unit).

- Disconnect J7001 on the DSP Unit, and remove the 12 screws affixing the MAIN Unit. Then tilt and pull the circuit board off (be careful not to break the wires).

- Remove the 3 screws on the shield plate and 2 screws deep in the holes (be careful not to drop the screws). Then pull the shield plate off to expose the LPF Unit.

Front Panel Disassembly

- With the top and bottom covers off, remove the screw at the top of each side, and loosen the 2 screws at the bottom of each side of the front panel.

- Slide the front panel assembly forward slightly, then tilt it open and down.

Transceiver Disassembly & PCB Unit Access

- Remove the 2 screws on the Display Unit. Pull the top of the front panel, and tilt and pull the Display Unit out (be careful not to break the wires or the front panel). This exposes the Key, VR and Jack Units.

Battery/Fuse Replacement & CPU Resetting

Lithium Battery Replacement

A 3-V type CR2032 lithium battery (BT0001, Yaesu p/n: Q9000564) is located on the MAIN Unit board of the transceiver. This maintains the memorized data in the transceiver. Battery life is normally greater than five years. If replacement is needed, perform the following steps:

- With the top and bottom covers removed, note the location of the battery. Using your finger, slide the battery inward (you will feel slight pressure from the mounting spring), then slightly pry it up and outward so that it ejects freely through the slot in the battery holder.
- Carefully note battery polarity with the positive (+) side facing upward, and battery type information. Install the replacement battery in the reverse manner.

Memory Back-Up Switch

The internal **BACKUP** switch on the MAIN Unit board is normally kept in the **ON** position to ensure memorized data is maintained (by a small amount of power from the lithium battery) when the radio is off, or the DC power source is removed.

- If you do not plan to operate your radio for extended periods of time, slide this switch to the **OFF** position to conserve battery life.
- Ensure the radio is on when sliding the switch back to the **ON** position, as this reduces the initial current demand on the battery by the radio's circuits from an unpowered state.

Note: Memorized settings are lost and the radio returns to factory default settings when turning off the backup battery.

Introduction and Precautions

The following procedures cover adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed by authorized Yaesu service technicians, experienced with the circuitry and fully equipped for repair and alignment. If a fault is suspected, contact the selling dealer for instructions regarding repair. Authorized Yaesu service technicians have the latest modification information, and realign all circuits and make compete performance checks to ensure compliance with the factory specifications after repairs.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Yaesu must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners. Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from unauthorized adjustments made with improper test equipment is not covered by warranty. Although most steps do not require all of the equipment

listed, the interaction of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in a section in the order they are presented.

Required Test Equipment

- Digital DC Voltmeter (high-Z, 1 M Ω /V)
- RF Millivoltmeter
- AC Voltmeter
- RF Standard Signal Generator w/ calibrated output and dB scale, 0 dB μ = 0.5 μ V
- AF Signal Generator with calibrated output
- Spectrum Analyzer or receiver (60 MHz)
- Frequency Counter
- 50- Ω Dummy Load (150 ~ 250 watts)
- 16.6- Ω Dummy Load (150 watts)
- In-Line Wattmeter (150 ~ 250 watts, 50- Ω)
- Linear Detector
- RF Attenuator (150 watts, 40 dB) or coupler

Alignment Preparation & Precautions

A 50- Ω dummy load and in-line wattmeter must be connected to the antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna. Except where specified otherwise, the transceiver should be tuned to 14.2000 MHz, USB mode, and these controls set as indicated:

- MOX, VOX, AGC, PROC, IPO, ATT OFF**
- MIC & RF PWR** fully CCW (minimum)
- AF** as required
- SQL** fully CCW (minimum)
- NOTCH & SHIFT** to 12-o'clock
- LOW CUT** fully CCW (minimum)
- HIGH CUT & RF GAIN** to fully CW (maximum)

Alignment

The transceiver's Alignment Menu mode is required for some procedures. If an Alignment Menu cannot be selected, power may have to be switched off and back on to re-enable menu selection, as follows:

- Turn the transceiver off, then press and hold **STEP** and **LOCK** (under the **VFO-A** dial) together while powering the transceiver on again.
- Input password "0751051", then press **ENT**.
- Press **MENU**, and select the required menu.

When finish the Alignment menu, press **MENU** to save and exit.

Read each step to determine if the same test equipment used in the previous step will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding. Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant within 20 ~ 30°C (68 ~ 86 °F). If the transceiver is brought into the

shop from hot or cold air, it should be allowed time for thermal equalization with the environment before alignment. Alignments must only be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in alignment are based on 0 dBμ = 0.5 μV.

Table Note: DC voltages should be within ±10 % of those listed in the voltage tables.
