This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
IMPORTANT

READ ALL INSTRUCTIONS CAREFULLY before attempting to operate the receiver.

SAVE THIS INSTRUCTION MANUAL— This instruction manual contains important safety and operating instructions for the IC-R10.

EXPLICIT DEFINITIONS

The following explicit definitions apply to this manual.

<table>
<thead>
<tr>
<th>WORD</th>
<th>DEFINITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>△ WARNING</td>
<td>Personal injury, fire hazard or electric shock may occur.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Equipment damage may occur.</td>
</tr>
<tr>
<td>NOTE</td>
<td>If disregarded, inconvenience only. No risk of personal injury, fire or electric shock.</td>
</tr>
</tbody>
</table>

Versions of the IC-R10 which display the “CE” symbol on the serial number seal, comply with the ETSI specification prETS300 684 (EMC product standard for Commercially Available Amateur Radio Equipment).

CAUTIONS

⚠ WARNING! NEVER connect the receiver to an AC outlet. This may pose a fire hazard or result in an electric shock.

⚠ WARNING! NEVER operate the receiver with a headset or other audio accessories at high volume levels. Hearing experts advise against continuous high volume operation. If you experience a ringing in your ears, reduce the volume level or discontinue use.

NEVER connect the receiver to a power source of more than 16 V DC such as a 24 V battery. This connection will ruin the receiver.

NEVER cut the DC power cable between the DC plug and fuse holder. If an incorrect connection is made after cutting, the receiver might be damaged.

NEVER expose the receiver to rain, snow or any liquids.

DO NOT connect the receiver to a power source using reverse polarity. This connection will not only blow fuses but also may damage the receiver.
DO NOT use or place the receiver in areas with temperatures below −10°C (+14°F) or above +50°C (+122°F) or, in areas subject to direct sunlight, such as the dashboard.

AVOID placing the receiver in excessively dusty environments.

AVOID the use of chemical agents such as benzine or alcohol when cleaning, as they damage the receiver surfaces.

Even when the receiver power is OFF, a slight current still flows in the circuits. Remove cell batteries from the receiver when not using it for a long time. Otherwise, the installed batteries will become exhausted.

For U.S.A. only
Caution: Changes or modifications to this receiver, not expressly approved by Icom Inc., could void your authority to operate this receiver under FCC regulations.

</table>
Electromagnetic radiation which has frequencies of 20,000 Hz (20 kHz*) and above is called radio frequency (RF) energy because it is useful in radio transmissions. The IC-R10 receives RF energy from 0.5 MHz to 1300 MHz* and converts it into audio frequency (AF) energy which in turn actuates a loudspeaker to create sound waves. AF energy is in the range of 20 to 20,000 Hz.

*kHz is an abbreviation of kilohertz or 1000 hertz, MHz is abbreviation of megahertz or 1,000,000 hertz, where hertz is a unit of frequency.
1 PANEL DESCRIPTION

Front and side panels

- **FUNCTION SWITCH** (pgs. 5, 6)
  While pushing [FUNC], the secondary functions of switches and controls can be accessed.

- **FUNCTION DISPLAY** (p. 3)
  Indicates the operating condition.

- **KEYPAD** (pgs. 5, 6)
  Numeral and other function keys for tuning and activating functions.

- **SPEAKER**
  Emits the receive audio.

- **CI-V JACK** (p. 73)
  Connect the optional OPC-478 CLONING CABLE for remote control or data cloning.

- **EXTERNAL DC POWER JACK** (p. 8)
  Connect the supplied wall charger for charging the installed Ni-Cd battery cells.
  **Be careful of overcharging!**
  Operation with an external DC power source simultaneously charges the installed batteries. When [CHARGE] switch is ON, see p. 8.
Top panel

**ANTENNA CONNECTOR (p. 9)**
Connects the supplied flexible antenna. Be careful when connecting an external antenna (See Operating Notes, p. iv).

**VOLUME CONTROL [VOL] (p. 10)**
Adjusts the audio output level.

**SQUELCH CONTROL [SQL] (p. 11)**
- Varies the squelch threshold point for audio mute.
  - Pushing [MONI] opens the squelch momentarily.
- Varies the RF gain in LSB, USB and CW modes.

**EXTERNAL SPEAKER JACK [SP]**
Connects an 8 ohm optional speaker or an earphone, if desired. The internal speaker will not function when either option is connected.

Connect the optional OPC-478/479 CLONING CABLE for cloning from a PC or another IC-R10 (p. 71).

**TUNING CONTROL [DIAL]**
Used to set an operating frequency (p. 15), memory channel (p. 24), etc.
Function display
① SLEEP TIMER INDICATOR
Appears while the sleep timer is activated (p. 66).

② FUNCTION INDICATOR
Appears while the function ([FUNC]) switch is pushed.

③ MEMORY MODE INDICATOR
Appears while in memory mode (p. 23).

④ VFO MODE INDICATOR
Appears while in VFO mode (p. 11).

⑤ RECEIVE MODE INDICATOR
Indicates the selected receive mode (p. 12).

⑥ EASY MODE INDICATOR
Appears while in easy mode (p. 50).

⑦ VSC INDICATOR
Appears while the VSC function is turned ON (p. 38).

⑧ ATTENUATOR INDICATOR
Appears while the attenuator is turned ON (p. 65).

⑨ AFC INDICATOR
Appears while the AFC function is turned ON (p. 63).

⑩ LOCK INDICATOR
Appears while the lock function is activated (p. 64).

⑪ MULTI-FUNCTION DOT MATRIX
Indicates the following items:
- Opening message (p. 10)
- Receive frequency (p. 11)
- Tuning steps (p. 13)
- Band scope (p. 17)
- Memory bank and channel number (p. 23)
- Memory name (p. 31)
- Memory bank name (p. 32)
- Programmable scan edges and name (p. 40)
- Priority frequency (p. 49)
- SET mode contents (p. 59)
- Signal strength indicator
# Keypad

</table>
Charging Ni-Cd batteries

The supplied Ni-Cd batteries are rechargeable and can be charged approx. 300 times. Charge the batteries before first operating the receiver or when the batteries become exhausted.

If you want to be able to charge the batteries more than 300 times, the following points should be observed:
1. Avoid overcharging. The charging period should be less than 48 hours.
2. Use the batteries until they become almost completely exhausted under normal conditions. We recommend battery charging just after receiving becomes impossible.

Charging precautions

NEVER attempt to charge dry cell batteries. This will cause internal liquid leakage and damage the receiver.

NEVER connect two or more chargers at the same time.

Charging may not occur under temperatures of 10°C (50°F) or over temperatures of 40°C (104°F).

About Ni-Cd batteries

Ni-Cd battery life
If your Ni-Cd batteries seem to have no capacity even after being fully charged, completely discharge them by leaving the power ON overnight. Then, fully charge the Ni-Cd batteries again. If the Ni-Cd batteries still do not retain a charge (or very little), new batteries must be purchased.

Recycling information (U.S.A. only)
The product that you purchased contains rechargeable batteries. The batteries are recyclable. At the end of their useful life, under various state and local laws, it may be illegal to dispose of these batteries into the municipal waste stream. Call 1-800-8-BATTERY for battery recycling options in your area or contact your dealer.
**Battery installation**

Install 4 AA (R6) size batteries as illustrated below.

Remove the cover from the receiver.

Install 4 AA (R6) size dry cell, alkaline or the supplied Ni-Cd batteries into the receiver.

**CAUTION:** Make sure the polarity of the batteries is correct before installing. Reverse polarity may damage the receiver.

**NOTE:** DO NOT use different types of batteries at the same time otherwise the receiver may not work properly.

**Charging connections**

Confirm that the [CHARGE] switch is ON, then connect the supplied wall charger via an AC outlet as shown below.

- **BC-110A/E/D/V*** Not supplied with some versions.
- **CP-12L** (optional)
  - To cigarette lighter socket
- **OPC-254L** (optional)
  - To power supply (4.8–13.5 V DC)

**CAUTION:** Make sure the [CHARGE] switch is in the OFF position when operating the receiver with one of the above power supplies.
2 Ni-Cd BATTERIES AND ACCESSORIES

Accessory attachment

**Antenna**
Insert the supplied antenna into the antenna connector and rotate the antenna as shown in the diagram below. Keep the jack cover attached when jacks are not in use to avoid bad contacts.

![Antenna Diagram](image)

**Belt clip**
Attach the belt clip using the supplied screws. Conveniently attaches to your belt.

![Belt Clip Diagram](image)

**Handstrap**
Attach the handstrap as shown in the diagram below. Facilities carrying.

![Handstrap Diagram](image)
### General

Operating the IC-R10 is easy. However, in order to get the most out of its operating potential, please go through the following procedures, step-by-step. Then, try the examples contained at the end of this chapter.

**What is VFO?**
The IC-R10 has several operating modes, each of which has its own distinct functions. VFO (Variable Frequency Operation) is one of these modes.

VFO mode is used to change the operating frequency, receive mode, tuning step, etc. Therefore, for most every day operations of the receiver, you will be using VFO mode.

### Selecting VFO mode

1. **Turn power ON**
   - Push [POWER] for 1 sec. to turn power ON.
   - Opening message is displayed for 1 sec.

2. **Adjust the volume**
   - Adjust the audio to a suitable level using [VOL].

   Check the squelch position (see next page) or VSC function setting (p. 38) if no audio is emitted.
3. Adjust the squelch

Rotate [SQL] maximum counterclockwise, then rotate it clockwise until audio is just muted when receiving no signal for FM, WFM or AM mode. (see right page)

What is squelch?
A squelch circuit allows you to mute undesired noise while receiving no signal and emit audio while receiving signals. This provides quiet standby. The [MONI] switch changes the squelch setting. This is useful for weak signal reception (p. 64).

3-1. Adjust the RF gain

Rotate [SQL] maximum counterclockwise, to adjust RF gain to optimum level.

What is RF gain?
RF gain controls receive sensitivity gain—reduce the gain when you don’t want to receive very weak signals or when excessively strong interfering signals are being received, etc.

4. Select VFO mode

When MEMORY mode is selected, push [V/M] to select VFO mode. When SET or TS set mode is selected, push [CLR] to select VFO mode.
• The VFO indicator appears.
Selecting a receive mode

What are receive modes?
Radio signals can be propagated in a variety of ways (or modes). Each mode has its own physical properties that determine to some degree its uses.

The IC-R10 receives the 6 most common modes: AM, FM, WFM, USB, LSB and CW. When you want to tune a station, you MUST set the receive mode first. The table below shows common uses for each mode.

<table>
<thead>
<tr>
<th>MODE</th>
<th>COMMON USAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM</td>
<td>amateur, aviation, broadcasting</td>
</tr>
<tr>
<td>FM</td>
<td>amateur, utility</td>
</tr>
<tr>
<td>WFM</td>
<td>TV broadcasting, FM broadcasting</td>
</tr>
<tr>
<td>USB, LSB</td>
<td>commercial, amateur, short wave radio</td>
</tr>
<tr>
<td>CW</td>
<td>commercial, amateur</td>
</tr>
</tbody>
</table>

Major symptoms of incorrect receive mode
Distorted sound
Sudden interruption in reception
Noise only
Noise with weak reception
Low or unstable signal strength indicator value

When programmed (see p. 69)
# Selecting a tuning step

**What are tuning steps?**

Tuning steps are the frequency change increments when you rotate the tuning control or operate a scan. The following steps are available: 0.1, 0.5, 1, 5, 6.25, 8, 9, 10, 12.5, 15, 20, 25, 30, 50, 100 kHz and user programmable tuning steps (p. 66).

It is important to set the proper tuning step for the type of station you want to listen to. Some tuning steps are determined by frequency band or receive mode and others are set by tradition.

Generally speaking, if you set a tuning step smaller than that needed you will still be able to tune a station you want (or scan it), however, tuning (or scanning) will not be efficient. On the other hand, if you select a tuning step which is too large, you may not be able to find the station you are looking for.

Consult local listings.

## 1. Call up the tuning step set mode

Once you have selected VFO mode and the desired receive mode, while pushing [FUNC], push [(MODE)TS].

## 2. Select the tuning step

1. Rotate [DIAL] to select the desired tuning step.
2. Push [CLR] to return to VFO mode after the selection.
Tuning a frequency (via the keypad)

When you know the exact frequency you want to listen to, the quickest way to tune it is by direct keypad entry.

Remember that the frequency must be between 0.5 MHz and 1300 MHz.

The diagram below shows the correlation between the function display frequency digits and the frequency.

1. Select the frequency

Select VFO mode and the receive mode in advance then:
Push the numeral keys in the same order as the frequency you want to tune (including the decimal key).

- If you make a mistake, push [CLR] and start again.

2. Enter the frequency

When the frequency you want is displayed:
Push [ENT] (or numeral keys for the 0.1 kHz digit) to enter it.

- When you select a frequency outside of the allowed range, the display will revert back to the previously displayed frequency.
3 BASIC OPERATION

- **Tuning a frequency** (via the dial)

When you want to listen to frequencies near the displayed frequency, the easiest way to tune them is with the tuning dial.

All signals have what is called an “occupied bandwidth.” They will be received as long as the receiver is tuned anywhere within this bandwidth. Even though the frequency received may not be the central frequency, the tuning step should be made as small as possible (0.5 or 5 kHz) and the receiver tuned to the point of greatest signal strength indicator deflection.

To change frequencies faster than the tuning step, use the dial select function (p. 16).

**1. Select VFO mode and a receive mode**

1. Push [CLR] or [V/M] to select VFO mode.
2. Push [MODE] to select a receive mode.

**2. Tune a frequency**

Rotate [DIAL] to change the frequency.
- The frequency changes in increments determined by the tuning step.
- To change the frequency faster, use the dial select function (p. 16).
Dial select steps

What are dial select steps?
When tuning with the dial, if you want to change the frequency faster than the selected tuning step can, use the dial select function.

A dial select step is an increment of frequency change much like a tuning step is. Unlike a tuning step however, a dial select step has no relation to the type of station you want to tune or to the scan operations.

Dial select steps are available for:

![Diagram showing dial select steps]

Changing the frequency with the dial select step

In VFO mode:
Push and hold [FUNC], then rotate [DIAL].

To change the dial select step:
While pushing [FUNC], push [(SCAN)DIAL SEL] one or several times until the frequency digit you want to change flashes.
3 BASIC OPERATION

Band scope function

What is the band scope function?
The band scope detects signal availability in the range of ±5 channels (up to ±100 kHz) from the displayed frequency, and displays the result on the multi function dot-matrix display. This gives you a visual reference of current band conditions.

In this case, channel refers to sweep step or channel space according to the set tuning step. For example, when the tuning step is set to 5 kHz, the band scope detects 25 kHz above and below the displayed frequency, then displays the result on the LCD.

When the tuning step is set above 20 kHz, the band scope function automatically changes its sweep step to 20 kHz. However, when the sweep step is changed to 20 kHz, the tuning step remains the same.

Also, when a user-programmable tuning step is selected, the band scope function automatically selects the 20 kHz sweep step.

Preparation

The band scope function is activated only when FM receive mode is selected in VFO mode.

1. Push [V/M] to select VFO mode. (p. 11)
2. Push [MODE] one or more times to select FM mode. (p. 12)
3. While pushing [FUNC], push [(MODE)TS]
4. Rotate [DIAL] to select the tuning/sweep step.
5. Push [CLR] to return to VFO mode.
Set band scope function

1. While pushing [FUNC], push [(1)BSCOPE].

Repeat the above step or push [CLR] to turn OFF the band scope function.
3 BASIC OPERATION

Listening example 1 — television broadcast in WFM mode

1. Turn power ON
   Push [POWER] for 1 sec. to turn power ON.

2. Select VFO
   Push [CLR] or [V/M] to select VFO mode.

3. Adjust volume
   Rotate [VOL] to obtain the desired level of audio output.

4. Adjust squelch
   Rotate [SQL] fully counterclockwise, then clockwise until the audio noise just disappears.

5. Select the receive mode
   Television sound is broadcast in WFM mode. If the receiver is not already in WFM mode:
   Push [MODE] one or more times until WFM appears in the function display.

6. Select the tuning step
   In most countries* television stations are spaced about 50 kHz apart. To select the 50 kHz tuning step:
   While pushing [FUNC], push [(MODE)TS], then rotate [DIAL] until the function display shows “50 kHz”. Push [CLR] after setting to return to VFO mode.

*Check listings for your area.
7. Tune the station

Use the keypad to enter the frequency — (example 59.75 MHz).

[Example]

5
9
.
7
5
ENT

(Example 59.25 MHz)

7-1. Tune the station

Enter the frequency from the 100 kHz digit when you want to change below the 1 MHz digit only — (example from 59.75 MHz to 59.25 MHz).

[Example]

8. Use the tuning dial

Rotate [DIAL] to search for nearby stations above and below the tuned frequency.

NOTE: WFM and regular FM share the same circuit. Depending on the receive condition, this may result in distortion. In such cases, try lowering the frequency 30–50 kHz.
### Basic Operation

<table>

General

What is memory mode?
MEMORY mode is the second operating mode—the first being VFO mode. MEMORY mode is used to store often-used frequencies, their receive modes, attenuator settings (p. 65), as well as skip information for scanning (p. 56). This provides convenient recall and scanning capabilities. Also, frequencies are receivable in MEMORY mode which means you can listen to received signals while you are in MEMORY mode.

The IC-R10 has 1000 memory channels for your convenience. They are divided into 18 banks: BANKS A to P contain 50 channels each for normal usage, while BANKS Q and R contain 100 channels each for auto-memory write scan (p. 41) and program skip scan (p. 45), respectively.

Each BANK and memory channel has BANK or memory name capabilities, for convenience. BANK names can be up to 10 characters; channel names up to 8 characters. Programmed contents and names can be easily copied to other channels using the memory copy function (p. 33) and easily edited using the EDIT function (p. 51).

Selecting MEMORY mode

Select MEMORY mode

Push [V/M] to select MEMORY mode.
• “MEMO” appears in the function display.
• Push [V/M] again to return to VFO mode.
## Selecting a BANK and memory channel

### Selecting a BANK channel

When your desired memory channel is not stored or you do not want to store a frequency in the displayed BANK, you must change the BANK number.

While pushing [FUNC], rotate [DIAL].

### Selecting a memory channel—1

If you want to recall a memory channel which has been memorized, this is the easiest way.

Rotate [DIAL].

### Selecting a memory channel—2

If you remember the memory channel number you want to recall, this is the fastest way to recall it.

Enter the full 2-digit memory channel number via the keypad.

Also, when you want to recall a blank channel for programming, you have to enter a channel number via the keypad.
Programming a memory channel — 1

This is the quickest way to memorize a received frequency, along with its receive mode and other information.

When you memorize the frequency in this way, the previously memorized data is replaced with the new data. If you do not want to lose the previously memorized data, select a blank channel number before programming (p. 24).

1. BANK and memory channel setting

1. Select MEMORY mode (p. 23).
2. Set the BANK and memory channel number (p. 24) you want to program to.

2. Setting other information

1. Select VFO mode (p. 11).
2. Set the frequency and receive mode (p. 12) you want in VFO mode.

3. Programming

While pushing [FUNC], push [(V/M)MW] to program the data.
- When programming is successfully completed, 3 beeps sound.
Programming a memory channel — 2

This is the simplest method to memorize the received frequency along with its receive mode and other information.

1. Setting receive conditions

1. Select VFO mode (p. 11).
2. Set the frequency and receive mode (p. 12).

2. BANK and memory channel setting

While pushing [FUNC], push [(V/M)MW].

3. BANK and memory channel setting

1. While pushing [FUNC], rotate [DIAL] to select the BANK you want to program into.
2. Rotate [DIAL] to select the memory channel you want to program.

4. Programming

While pushing [FUNC], push [(V/M)MW] for 2 sec. to program the data.
• When programming is successfully completed, 3 beeps sound and VFO mode is automatically selected.
4 MEMORY MODE

Programming a memory channel — 3

This is the easiest way to memorize the received frequency, mode and other information along with memory, BANK names, scanning condition, etc. in one operation.

1. Set up

① Set the frequency you want to program in VFO mode.

② While pushing [FUNC], push [(V/M)MW] to enter memory write mode.

2. BANK and memory channel setting

① While pushing [FUNC], rotate [DIAL] to select the BANK you want to program (p. 24).

② Rotate [DIAL] or push 2 digit keys to select the memory channel you want to program (p. 24).

3. Programming details

① Push [EDIT] to enter memory programming mode.

② Rotate [DIAL] or enter the alphanumeric characters via the keypad to program a memory name.
   • When you enter channel names with [DIAL] or a character assigned to the same key, push [ENT] before you enter the next character to change the digit (see page 72 for alphanumeric key assignments).

3. Push [EDIT], then rotate [DIAL] to select receive mode.

4. Push [EDIT], then rotate [DIAL] to select the skip scan condition.

5. Push [EDIT], then rotate [DIAL] to select the attenuator condition.

6. Push [EDIT], then rotate [DIAL] or enter alphanumeric characters to program a BANK name. • When you enter channel names with [DIAL] or a character assigned to the same key, push [ENT] before you enter the next character to change the digit (see page 72 for alphanumeric key assignments).

7. Push [EDIT], to display your programmed frequency for confirmation. When the correct frequency is displayed, push [EDIT] for 2 sec. to return to VFO mode.

When you want to return to VFO mode immediately, push [EDIT] for 2 sec. at any time.
Programming example 1 — (118.0250 MHz; AM to channel B07)

1. BANK and memory channel setting

1. Push [V/M] to select MEMORY mode.
2. While pushing [FUNC], rotate [DIAL] to select BANK “B”.
3. Push [0] and [7] to enter the memory channel number.

"BLANK" appears when the memory channel is not programmed.

2. Data setting

1. Push [V/M] to select VFO mode.
2. Push [MODE] one or more times to select AM mode.
3. Push numeral keys or rotate [DIAL] to set the frequency 118.0250 MHz.

3. Programming the data

While pushing [FUNC], push [(V/M)MW] for 2 sec.
## Programming example 2 — (59.75 MHz; WFM to channel A45)

### 1. Setting the frequency

1. Push [V/M] to select VFO mode.
2. Push [MODE] one or more times to select WFM mode.
3. Push numeral keys or rotate [DIAL] to set the frequency to 59.75 MHz.

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>VFO</td>
<td>WFM</td>
<td>59.7500</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 2. Set the BANK and memory channel

1. While pushing [FUNC], push [(V/M)MW] to enter memory write mode.
2. While pushing [FUNC], rotate [DIAL] to select BANK “A”.

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>VFO</td>
<td>WFM</td>
<td>SET CH NO.</td>
<td>A45</td>
<td>BLANK</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

“BLANK” appears when the memory channel is not programmed.

### 3. Programming the data

While pushing [FUNC], push [(V/M)MW] for 2 sec.
4 MEMORY MODE

Programming example 3 — (121.5 MHz, EMER., AM, SKIP: OFF, ATT: OFF, Aviation to channel F01)

1. Setting the frequency
   ① Push [V/M] to select VFO mode.
   ② Rotate [DIAL] or push numeral keys to enter 121.5 MHz.

   ![VFO 121.5000]

2. BANK and memory channel setting
   ① While pushing [FUNC], push [(V/M)MW].
   ② While pushing [FUNC], rotate [DIAL] to select BANK “F”.

   ![SET BANK F]

   ③ Rotate [DIAL] or push [0] then [1] to select channel “01”.

   ![SET CH NO. F01 BLANK]

3. Programming details
   ① Push [EDIT] to enter memory setting mode.

   ![EDIT]

   ② Rotate [DIAL] until the character “E” appears then push [ENT] or push [3] twice to enter the “E.”

   ![SET CH NAME F01 E]

   ③ Rotate the [DIAL] then push [ENT] to enter the characters “M”, “E”, “R” and “.” for memory names or push numeral keys (see page 72 for alphanumeric key assignments).

5. Push [EDIT] to change the receive mode item.
6. Rotate [DIAL] to select AM mode, then push [EDIT] to change the item.

7. Rotate [DIAL] to select the OFF position for SKIP setting, then push [EDIT].

8. Rotate [DIAL] to select the OFF position for attenuator setting, then push [EDIT].

9. Rotate [DIAL] until the character “A” appears, then push [ENT] or push [2] once to enter “A”.

10. Rotate [DIAL] then push [ENT] to enter the characters for BANK names or push numeral keys (see page 72 for alphanumeric key assignments).

11. The display shows the programmed frequency for confirmation; push and hold [EDIT] for 2 sec. if the frequency is correct.
   • After pushing and holding [EDIT], VFO mode is automatically selected.
4 MEMORY MODE

Memory copy

What is the memory copy function?
The memory copy function copies the contents (minus BANK names) of the selected memory channel to VFO or to another memory channel. This is quite useful when you want to search for signals around the displayed frequency or when you want to edit memory channels.

Copy to VFO mode

1. Push [V/M] to select memory mode.
2. Select the BANK and memory channel you want to copy (p. 24).
3. While pushing [FUNC], push [(V/M)MW] for 2 sec.

Copy to the other memory channel

1. Push [V/M] to select memory mode. (p. 23)
2. Select the BANK and memory channel you want to copy (p. 24).
3. While pushing [FUNC], push [(V/M)MW].
4. Set the BANK and channel number you want to copy to (p. 24).
5. While pushing [FUNC], push [(V/M)MW] for 2 sec.
■ Copying example 1  
(59.7500 MHz, WFM, A45 to VFO)

1 Push [V/M] to select memory mode (p. 23).
2 Select the memory channel A45 (p. 24).
3 While pushing [FUNC], push [(V/M)MW] for 2 sec. to copy the contents of memory A45 to VFO.
   •VFO mode is automatically selected.

■ Copying example 2  
(118.0250 MHz, AM, B07 to F02)

1 Push [V/M] to select memory mode (p. 23).
2 Select the memory channel B07. (p. 24)
3 While pushing [FUNC], push [(V/M)MW].
4 While pushing [FUNC], rotate [DIAL] to select BANK “F”.
5 Rotate [DIAL], or push [0], [2] to select channel “02”.
6 While pushing [FUNC], push [(V/M)MW] for 2 sec. to transfer the contents of B07 to F02.
Filtering can be used to quickly search for active memories.

### Filter function

The filter function allows you to set specific conditions for the scan criteria, enabling you to quickly and efficiently search for desired signals. By adjusting the filter settings, you can narrow down the range of frequencies or channels to be scanned, ensuring that only those signals that meet your criteria are detected.

### Filter options

The filter options available to you will vary depending on your device. Typically, you may be able to set filters based on frequency bands, signal strength, or specific signal characteristics. By selecting the appropriate filter options, you can tailor your search to focus on signals of interest.

### Using the filter function

To use the filter function, follow these general steps:

1. Access the filter settings within your scanning application or device.
2. Define your filter criteria according to your needs.
3. Initiate the scan operation with the filtered settings.
4. Observe the results and adjust as necessary.

By utilizing these advanced features, you can effectively narrow down the search space, allowing you to focus on the signals that are most relevant to your task.
PROGRAM SCAN
Repeatedly scans between two user-programmed frequencies (scan edges).

AUTO-MEMORY WRITE SCAN
Same as PROGRAMMED SCAN except that paused frequencies are automatically stored in memory channels Q00–Q99.

BANK SCAN
Repeatedly scans all memory channels in the selected BANK except blank channels.

MODE SELECT SCAN
Repeatedly scans all memory channels with the selected receive mode.
Before scanning

Set the following conditions before scanning.

**INFORMATION**

*What happens when you rotate the tuning dial during scanning?*

**While scanning—**
Scanning direction is changed.

*Example:*
If you rotate [DIAL] counterclockwise while scanning up (frequency/memory channel number increase), scan changes to down scanning (frequency/memory channel number decrease).

**While pausing—**
Scanning starts again (pause is cancelled).

1. **Set receive mode**

Set any receive mode EXCEPT USB, LSB and CW.

2. **Set the volume and squelch levels**

Set [VOL] to a suitable audio output level.

Set [SQL] so that the noise audio is just muted.
Set the VSC

Set the VSC ON if necessary.
While pushing [FUNC], push [(2)VSC] (VSC indicator appears).

While pushing [FUNC], push [(2)VSC) to turn OFF the VSC (VSC indicator disappears).

What is VSC?
The VSC (Voice Scanning Control) pauses a scan only when modulated signals are received. Scanning continues when unmodulated or beat signals are received.

Set the scan delay

Set the scan delay.
While pushing [FUNC], push [(CLR)SET], then push [EDIT] one or more times until SCAN DELAY appears (p. 62).

Rotate [DIAL] to set the scan delay time.

Push [CLR] to return to VFO or MEMORY mode.

What is scan delay?
Scan delay affects scan pausing as follows:

<table>
<thead>
<tr>
<th>Delay</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5SEC</td>
<td>scan automatically resumes 5 sec. after pausing</td>
</tr>
<tr>
<td>10SEC</td>
<td>scan automatically resumes 10 sec. after pausing</td>
</tr>
<tr>
<td>PAUSE</td>
<td>scan automatically resumes 2 sec. after a received signal disappears</td>
</tr>
</tbody>
</table>
Full scan

This is the simplest scanning operation, searching the full frequency range (0.5–1300 MHz) in the selected receive mode and tuning step.

Start and stop the scan

1. Push [V/M] to select VFO mode. (p. 11)

   To change the direction of the scanning, rotate [DIAL] during scanning.

   When the program skip function is ON (p. 61), frequencies stored in BANK R memories are skipped. Also, “SKIP” is displayed.

Memory scan

This is the simplest way to search for all stored frequencies in memory channels.

Start and stop the scan

1. Push [V/M] to select MEMORY mode.

   To change the direction of the scan, rotate [DIAL] during scanning.

   When the memory skip function is ON (p. 61), specified memory channels (p. 56) are skipped. Also, “SKIP” is displayed.

Program scan

This is the most useful basic scan for searching over a specified frequency range.

1. Select program scan channel

1. Push [V/M] to select VFO mode (p. 11).

2. While pushing [FUNC], push [(4)PROG-S].

Rotate [DIAL] to select the program scan channel.

Displays “PROGRAM SCAN” with program channel number and the names for 2 sec., then scan edges, “S” and “E”, are displayed.

Displays “S (start)” and “E (end)” frequencies after 2 sec.

2. Start and stop scanning

Push [SCAN] to start scanning.

To change the direction of the scan, rotate [DIAL] during scanning.

When the program skip function is ON (p. 61), frequencies stored in BANK R memories are skipped. Also, “SKIP” is displayed.

Push [CLR] or [SCAN] to stop scanning.

When the same frequency is stored in both scan edges, program scan will not proceed.

The default frequency range is 144.0000–146.0000 MHz. Set up scan frequency ranges before starting program scan. See page 57 for program scan channel setup.
5 SCANNING OPERATION

Auto memory write scan

This scan is useful for searching a specified frequency range and automatically storing busy frequencies into memory channels. The same frequency ranges used for program scan are used for auto memory write scan.

1. Select program scan channel

① Push [V/M] to select VFO mode (p. 11).

② While pushing [FUNC], push [(5)AMWS].

Rotate [DIAL] to select the program scan channel.

Displays “PROGRAM AMWS” with program channel number and the names as program scan channel.

Displays “S (start)” and “E (end)” frequencies after 2 sec.

2. Start and stop scanning

Push [SCAN] to start scanning.

To change the direction of the scan, rotate [DIAL] during scanning.

When the program skip function is ON (p. 61), frequencies stored in BANK R memories are skipped. Also, “SKIP” is displayed.

Push [CLR] or [SCAN] to stop scanning.
During auto-memory write scanning:

1. Busy (paused) frequencies are automatically stored into BANK Q memory channels.
2. The scan is automatically cancelled when BANK Q becomes full.
3. Unmodulated or beat signals may not be stored into memory channels when the VSC function is turned ON.
4. While pushing [FUNC], push [(V/M)MW] when unwanted signals (ones you don’t want to store) are received.

For your convenience:

Auto-memory write scan automatically clears all previously stored information when it is started. Therefore, it is a good idea to copy desired frequency data memorized during auto-memory write scan into BANK A to P’s memory channels before operating the scan.
BANK scan

Scans all stored frequencies into a specified BANK, except for SKIP channels.

1. Select BANK scan and BANK number

① Push [V/M] to select MEMORY mode (p. 23).

② While pushing [FUNC], push [(8)BANK-S].

Rotate [DIAL] to select the BANK number.

Displays “BANK SCAN” with BANK number and the names.

2. Start and stop scanning

Push [SCAN] to start scanning.

To change the scan direction, rotate [DIAL] during scanning.

When the memory skip function is ON (p. 61), specified memory channels (p. 56) are skipped. Also, “SKIP” is displayed.

Push [CLR] or [SCAN] to stop scanning.

The specified BANK must have 2 or more stored channels, otherwise, the scan will not proceed.
Mode select scan

Scans all stored frequencies that have the specified receive mode, except SKIP channels.

1. Select mode select scan and mode

1. Push [V/M] to select MEMORY mode (p. 23).

2. While pushing [FUNC], push [(7)MODE-S].

   Displays “MODE SCAN”.

3. Push [MODE] once or more times to select the receive mode.

2. Start and stop scanning

Push [SCAN] to start scanning.

Flashes while scanning

To change the scan direction, rotate [DIAL] during scanning.

When the memory skip function is ON (p. 61), specified memory channels (p. 56) are skipped. Also, “SKIP” is displayed.

Push [CLR] or [SCAN] to stop scanning.

If 2 or more channels do not have the specified receive mode, scan will not proceed.
5 SCANNING OPERATION

■ Skip function

Two skip functions are available as follows:

1. Program skip function
Used with full, program and auto-memory write scans, this function allows you to skip specified frequencies stored in BANK R (skip function must be ON for these channels).

2. Memory skip function
Used with memory, BANK and mode select scans, this function allows you to skip specified memory channels.

These are activated when PROGRAM SKIP or MEMORY SKIP is turned ON in set mode (p. 59). Their factory pre-programmed settings are:

- PROGRAM SKIP : OFF
- MEMORY SKIP : ON

1. Program skip setting

1. Set PROGRAM SKIP to ON in set mode (p. 59).

2. Push [V/M] to select VFO mode. (p. 11)

3. Start full or program scan (p. 35).

4. While pushing [FUNC], push [(V/M)MW] during scan pause if you want to skip the paused frequency.

Skip frequencies are stored in BANK-R memory channels (counting down from channel 99 to 00).

2. Program skip setting — cont.

When BANK R becomes full, an error beep sounds when trying to set more skip frequencies.

When you want to cancel the skip function, turn OFF the SKIP setting in the memory channel (p. 56).

5. After set up, push [SCAN] or [CLR] to stop scanning.

Stored frequencies are skipped during the next full, program or auto-memory write scan operation.

1. Memory skip setting

Set the skip condition in each memory channel—refer to p. 55 MEMORY EDIT for details.
### SIGNAVI function

The SIGNAVI function activates while paused during full, program or auto-memory write scans in FM mode. It searches for busy frequencies up to 100 kHz* (+100 kHz when scanning up, −100 kHz when scanning down) from the paused frequency (f₀), then jumps to the next busy frequency (f₁) detected (by SIGNAVI) when scan resumes.

*The SIGNAVI search range varies according to tuning step settings. The maximum range is 5 channels or steps from the receive frequency, therefore, the tuning step must be equal to or smaller than 20 kHz.

---

#### 1. Set SIGNAVI function

1. Push [V/M] to select VFO mode (p. 11).
2. While pushing [FUNC], push [(6)SIGNAVI].
   - Displays “SIGNAVI” below frequency.

#### 2. Select scan type and start scanning

1. While pushing [FUNC], push [(4)PROG-S] for program scan or [(5)AMWS] for auto-memory write scan, then rotate [DIAL] to select scanning frequency band.
   - Confirm that the receive mode of the selected scan band is FM and also that the tuning step is equal to or smaller than 20 kHz.
   - If you want to search the entire frequency range (0.5–1300 MHz) skip this step.

---

*SIGNAVI function

The SIGNAVI function activates while paused during full, program or auto-memory write scans in FM mode. It searches for busy frequencies up to 100 kHz* (+100 kHz when scanning up, −100 kHz when scanning down) from the paused frequency (f₀), then jumps to the next busy frequency (f₁) detected (by SIGNAVI) when scan resumes.

*The SIGNAVI search range varies according to tuning step settings. The maximum range is 5 channels or steps from the receive frequency, therefore, the tuning step must be equal to or smaller than 20 kHz.

---

#### 1. Set SIGNAVI function

1. Push [V/M] to select VFO mode (p. 11).
2. While pushing [FUNC], push [(6)SIGNAVI].
   - Displays “SIGNAVI” below frequency.

#### 2. Select scan type and start scanning

1. While pushing [FUNC], push [(4)PROG-S] for program scan or [(5)AMWS] for auto-memory write scan, then rotate [DIAL] to select scanning frequency band.
   - Confirm that the receive mode of the selected scan band is FM and also that the tuning step is equal to or smaller than 20 kHz.
   - If you want to search the entire frequency range (0.5–1300 MHz) skip this step.
General

What is priority watch?
Priority watch checks for signals on a priority frequency while listening to another frequency or, while searching one or more frequencies or memory channels.

When receiving a signal on the priority channel, priority watch pauses for 5 sec.

This function is useful when you want to monitor for a signal that appears infrequently. In this case, you can wait for the signal while listening to another signal on a different frequency.

Types of priority watch
There are two basic priority watches: VFO FREQUENCY WATCH and MEMORY CHANNEL WATCH. Also, the priority watch can be activated in conjunction with a scanning function, thereby making a total of 8 priority watch operations.

The following diagrams illustrate the operation of each priority watch type.
FULL SCAN WATCH/PROGRAM SCAN/AUTO-MEMORY WRITE SCAN WATCH

While scanning the full frequency range or a programmed frequency range, priority watch checks for signals on the priority frequency every 5 sec.

• When the skip function is ON, skips specified frequencies.
• The priority frequency is never programmed into BANK Q even if a signal is received on the priority frequency when auto-memory write scan is selected.

MEMORY SCAN/BANK SCAN/MODE SELECT SCAN WATCH

While scanning all or selected memory channels, priority watch checks for signals on the priority frequency every 5 sec.

• When the skip function is ON, skips specified memory channels.
• When the selected BANK or receive mode is not memorized, priority watch does not start.
1. Program a priority channel

144.0000 MHz is initially programmed by default.

1. Select the frequency you want to program into the priority channel in VFO mode (p. 11) or MEMORY mode (p. 23).

2. While pushing [FUNC], push [(9)PRIO] for 2 sec.

Start priority watch automatically.

2. Set MAIN frequency

Set the frequency in VFO mode (pgs. 14, 15) or select the memory channel (p. 24) you want to listen to with the priority channel, or start scanning (p. 35).

Flashes when priority watch is selected scanning

Appears while watching frequency or band

While pushing [FUNC], push [(9)PRIO], or push [CLR] only to stop priority watch.
### General

The IC-R10 has an EASY mode which provides simple operation by only scanning programmed frequency ranges. When you select EASY mode, 1 of 10 pre-programmed frequency ranges can be selected.

10 different frequency ranges are programmed for EASY mode operation in some transceiver versions; however, 0.5–1300.0000 MHz with FM receive mode is pre-programmed into all 10 channels in other versions.

Settings for each range are programmable. See page 55, before you operate in EASY mode, in case EASY mode doesn’t have the frequency ranges you want or when you want to set up preferred conditions.

### EASY mode operation

1. **Select EASY mode**
   - Push [EASY] to select EASY mode.

2. **Select frequency range and start scanning**
   - Push a numeral key to select a frequency range to search.
   - Push [SCAN] to start scanning.
   - Push [SCAN] or [CLR] to stop scanning.

Appears

Flashes while scanning
EDIT FUNCTION

■ General

The edit function is used for arranging memorized contents into the following channels:

Memory channels
Program/auto-memory write scan channels
EASY mode channels

■ Memory channel edit

You can store the following items into a memory channel:

1. Frequency settings: (SET FREQ)
   Memorized frequencies can be edited or erased.

2. Channel names: (SET CH NAME)
   Alphanumeric names can be input or edited. (Up to 8 characters per name.)

3. Receive mode: (SET MODE)
   Receive mode can be specified.

4. SKIP setting: (SET SKIP)
   SKIP settings can be toggled ON or OFF for memory skip scan (pgs. 39, 43, 44).

5. Attenuator setting: (SET ATT)
   Attenuator settings can be toggled ON or OFF.

6. BANK names: (SET B-NAME)
   Alphanumeric names can be input or edited. (Up to 10 characters per name.)
Memory channel edit flow chart

*1 Push for 2 sec.
*2 Fixed contents will be cleared.
### Memory channel edit

<table>
<thead>
<tr>
<th>1. Enter memory edit mode</th>
<th>2. Set frequency</th>
<th>3. Set channel names</th>
</tr>
</thead>
<tbody>
<tr>
<td>① Push [V/M] to select MEMORY mode, then select the memory channel (pgs. 23, 24). ② Push [EDIT] to enter memory edit mode.</td>
<td>① Enter the frequency via the keypad or by rotating [DIAL]. ② Push [EDIT] to change the item.</td>
<td>① Enter channel names via the keypad or by rotating [DIAL]. - When you enter channel names from the [DIAL] or a character assigned in the same key, push [ENT] before you enter the next character to change the digit (see page 72 for alphanumeric key assignment). ② Push [EDIT] to change the item.</td>
</tr>
</tbody>
</table>

**MEMO**

- FM SET CH NAME A00
  - [DIAL]
  - SET CH NAME
  - A00

- FM SET FREQ 144.0000
  - [DIAL]
  - or digit keys
  - SET FREQ
  - 144.0000
4. Set receive mode and skip condition

1. Rotate [DIAL] to select receive mode.

   ![MEMO FM SET MODE MODE: FM]

2. Push [EDIT] to change the item.

   ![MEMO FM SET SKIP SKIP: OFF]

4. Push [EDIT] to change the item.

5. Set attenuator condition

1. Rotate [DIAL] to select attenuator condition.

   ![MEMO FM SET ATT ATT: OFF]

2. Push [EDIT] to change the item.

6. Set BANK names

1. Enter BANK names from the keypad or via [DIAL] as for channel name setting (see page 72 for alphanumeric key assignments).

2. Push and hold [EDIT] to enter the fixed contents.
   - Push [EDIT] one or more times to confirm the entered contents, or push [CLR] to cancel all entered contents, if required.
Program scan channel edit

Arrange memorized contents into program scan channels 00 to 19.
You can edit the following items:

1. *Channel names*: \((SET \ CH \ NAME)\)
   - Set channel names for programmed frequency range; up to 8 characters per name.

2. *Scan band edge 1*: \((START \ FREQ)\)
   - Set the start frequency for scan frequency range.

3. *Scan band edge 2*: \((END \ FREQ)\)
   - Set the end frequency for scan frequency range.

4. *Receive mode*: \((SET \ MOD)\)
   - Select a receive mode.

5. *Tuning step*: \((SET \ TS)\)
   - Select or program a tuning step.

6. *Scan delay time*: \((SCAN \ DELAY)\)
   - Select the scan delay (pausing) time.

EASY mode channel edit

Arrange memorized contents in EASY mode channels 0 to 9.
You can edit the following items:

1. *Channel names*: \((SET \ CH \ NAME)\)
   - Set channel names for programmed frequency range; up to 8 characters per name.

2. *Scan band edge 1*: \((START \ FREQ)\)
   - Set the start frequency for scan frequency range.

3. *Scan band edge 2*: \((END \ FREQ)\)
   - Set the end frequency for scan frequency range.

4. *Receive mode*: \((SET \ MOD)\)
   - Select a receive mode.

5. *Tuning step*: \((SET \ TS)\)
   - Select or program a tuning step.

6. *Scan delay time*: \((SCAN \ DELAY)\)
   - Select the scan delay (pausing) time.
Program/auto-memory write scan and EASY mode channel edit flow chart

- **FM**
  - **VFO**
    - Start Frequency: 144.0000
    - End Frequency: 146.0000
  - **EASY**
    - Set Frequency: 144.0000

- **EDIT**
  - Push for 2 sec.
  - Fixed contents will be cleared.
**Program scan or EASY mode channel edit**

### 1. Enter edit mode

1. Push [V/M] or [EDIT] to select VFO or EASY mode (p. 11 or 50).
2. While pushing [FUNC], push [(4)PROG-S] or [(5)AMWS] to select program or auto-memory write scan mode; then select the scan channel (pgs. 40, 41) when VFO mode is selected in 1, push digit key to select scan channel when EASY mode is selected in 1.

### 2. Set channel names

1. Enter channel names from the keypad or by rotating [DIAL].
   - When you enter channel names with [DIAL] or a character assigned to the same key, push [ENT] before you enter the next character to change the digit (see page 72 for alphanumeric key assignments).
2. Push [EDIT] to change the item.

### 3. Set start frequency

1. Enter the start frequency via the keypad or [DIAL].
2. Push [EDIT] to change the item.
4. Set end frequency

1. Enter the start frequency via the keypad or [DIAL].
2. Push [EDIT] to change the item.

5. Set receive mode and tuning step

1. Rotate [DIAL] to select receive mode.
2. Push [EDIT] to change the item.
4. Push [EDIT] to change the item.

6. Set scan delay time

1. Rotate [DIAL] to select scan delay time.
2. Push and hold [EDIT] to enter the set contents.
   • Push [EDIT] one or more times to confirm the set contents, or push [CLR] to cancel, if desired.
General

*What is SET mode?*

SET mode is accessed from VFO, MEMORY or EASY mode and allows you to modify certain receiver conditions to suit your operating requirements.

Adjusting these settings to your own individual preferences allows you to “customize” the receiver’s operating parameters to suit your operating style.

If you are not sure what effect changing a particular condition will have on the receiver’s performance—experiment with different settings. Don’t worry, there is no way you can damage the receiver by altering these settings.

There are 11 conditions which can be modified in SET mode. The displays at right show the initial or all reset (p. 70) conditions. See the following pages for an example of each condition and how to modify them.
**Entering SET mode**

While pushing [FUNC], push [(CLR)SET] to enter SET mode.

Push [EDIT] to select next item.

**Opening message**

Rotate [DIAL] to toggle opening message ON or OFF.

- MESSAGE ON
- MESSAGE OFF

**Beep audio**

Rotate [DIAL] to set beep audio ON or OFF.

- BEEP ON
- BEEP OFF

**Display contrast**

Rotate [DIAL] to adjust the LCD contrast to a suitable level.

- CONTRAST LOW
- CONTRAST HI
### 9 SET MODE

<table>
<thead>
<tr>
<th><strong>Backlight condition</strong></th>
<th><strong>Program skip condition</strong></th>
<th><strong>Memory skip condition</strong></th>
<th><strong>Power save condition</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Rotate [DIAL] to set LCD and key backlight conditions.</td>
<td>Rotate [DIAL] to toggle the program skip scan condition ON or OFF.</td>
<td>Rotate [DIAL] to toggle the memory skip scan condition ON or OFF.</td>
<td>Rotate [DIAL] to select the power save ratio or turn the function OFF.</td>
</tr>
</tbody>
</table>

- **Backlight**
  - LIGHT ON
  - LIGHT AUTO 5SEC
  - LIGHT OFF

- **Program Skip**
  - PROGRAM SKIP OFF
  - PROGRAM SKIP ON

- **Memory Skip**
  - MEMORY SKIP OFF
  - MEMORY SKIP ON

- **Power Save**
  - POWER SAVE 1:4
  - POWER SAVE 1:16
  - POWER SAVE OFF
Scan delay condition

Rotate [DIAL] to set the scan pausing time.

- SCAN DELAY 5SEC
- SCAN DELAY 10SEC
- SCAN DELAY PAUSE

CI-V address

Rotate [DIAL] to select the CI-V address from 01 to 7F.

- CI-V ADDRESS 01
- CI-V ADDRESS 52
- CI-V ADDRESS 7F

CI-V baud

Rotate [DIAL] to select CI-V baud from 300, 1200, 4800, 9600 and 19200 bps.

- CI-V BAUD 300
- CI-V BAUD 1200
- CI-V BAUD 4800
- CI-V BAUD 9600
- CI-V BAUD 19200

1200 bps is the optimum baud rate for CI-V control.

CI-V transceive

Rotate [DIAL] to toggle CI-V transceive function ON or OFF.

- CI-V TRN OFF
- CI-V TRN ON
10 OTHER FUNCTIONS

- **Low battery indicator**
  The low battery indicator activates when the installed batteries fall to a specified voltage level. The receiver emits beeps and displays “LOW BATTERY” to inform you that battery capacity is low. Beeps sound once every 10 sec. and are synchronized with the beep setting in SET mode (p. 60).

  ![Low battery indicator](image)
  
  Appears once every 5 sec.

- **AFC function**
  The AFC (Automatic Frequency Control) function tunes the displayed frequency automatically when an off-center frequency is received. It activates in FM modes only.

  ![AFC function](image)

  Setting AFC
  While pushing [FUNC], push [(.]AFC] to toggle the AFC function ON and OFF.
■ Monitor function

The monitor function releases the squelch or VSC mute momentarily when very weak signals are received without having to re-adjust the squelch manually.

**Set monitor**

While pushing [MONI], squelch mute is released; when the VSC function is ON, both squelch and VSC mute are released.

■ Lock function

The lock function is available so that you can listen to one frequency continuously and not worry about accidentally changing it or activating an undesired function.

**Set lock**

While pushing [FUNC], push [(EDIT)LOCK] to toggle the lock function ON and OFF. All switches and controls are electronically locked except for [POWER], [MONI] and [FUNC].

Appears
10 OTHER FUNCTIONS

- ATT function

The ATT (attenuator) function protects desired signals from distorting when excessively strong signals, such as broadcast, pager signals, etc. are nearby. This setting can be memorized into memory channels.

Set ATT

While pushing [FUNC], push [(0)ATT] to toggle the ATT function ON and OFF.

- NB/ANL function

The NB (noise blanker) function removes pulse-type noise when USB, LSB or CW is selected. The ANL (automatic noise limiter) function reduces noise components when AM is selected.

Set NB/ANL

While pushing [FUNC], push [(ENT)NB/ANL] to toggle the NB or ANL function ON and OFF.
Sleep timer function*

The sleep timer activates after a specified time elapses, automatically turning the receiver power OFF.

**Set sleep timer**

1. While pushing [FUNC], push [(3)SLEEP] one or more times to set the sleep timer condition.
2. Release [FUNC] to set the selected condition.
3. When the specified time elapses, the receiver emits 5 beeps then powers OFF.

*When you want to use the sleep timer function in EASY mode—set it in VFO or MEMORY mode first, then enter EASY mode.

User TS setting

The user programmable tuning step allows you to set optimum tuning steps for specific channel spacing using the [DIAL].

**Set tuning step**

1. Enter tuning step set mode (p. 13), then rotate [DIAL] until “USER TS” appears.
2. Enter the desired tuning step using the numeral keys (including the decimal key, if necessary).
   • User tuning step is selectable from 0.1 kHz to 999.90 kHz (0.1 kHz step).
3. Push [CLR] to set tuning step and return to VFO.
Memory search function

The memory search function searches memory channels using channel names. This is useful for recalling memory channels when you forget their channel number.

Enter memory search mode

1. Push [V/M] to select MEMORY mode (p. 23).
2. While pushing [FUNC], push [(EASY)SEARCH].

Enter memory channel names

Enter memory channel names via the keypad or [DIAL].
• When you enter channel names with [DIAL] or a character assigned to the same key, push [ENT] before you enter the next character to change the digit (see page 72 for alphanumeric key assignments).
Refer to memory edit for entering alphanumeric characters.
Searching

Push [SCAN] to start memory channel search.
- Only the first one or two characters are needed to start a search. Smaller channel numbers are displayed first in cases where two or more channels start with the same characters.
- Push [SCAN] again to display the next candidate in a search.

Selecting a memory channel

Push [ENT] to select a memory channel.

Auto mode and TS function

The auto receive mode select and auto tuning step select functions are optionally available. This function can be set up and modified by programming from a computer using the optional CS-R10 CLONING SOFTWARE. Some versions may be pre-programmed.

Set auto TS

While pushing [FUNC], push [(MODE)TS] in VFO mode, then rotate [DIAL] to select “TS AUTO”.

The auto tuning step and receive mode select functions can be set up by dividing the operatable frequency range into up to 15 bands. For details contact your nearest dealer or local distributor.

Set auto mode

Push [MODE] one or more times, in VFO mode, until “AUTO MODE” appears, then push [CLR] to return to VFO mode.
Reseting the CPU

There are 2 ways to reset the CPU as follows:

PARTIAL RESET:
When you want to initialize the operating conditions (VFO frequency, VFO settings, SET mode contents) without clearing the memory, program scan, EASY mode and auto TS/mode settings, a partial reset function is available for the receiver.

ALL RESET:
Use this option when the CPU malfunctions.

CAUTION: Resetting the CPU returns all programmed contents to their default settings.

**Partial reset**

1. Turn power OFF.
2. While pushing [MODE], push [POWER] for 1 sec. to turn power ON.
3. Rotate [DIAL] to select "YES" or "NO", then push [ENT].
   A partial reset is performed when "YES" is selected; selecting "NO" cancels the operation.

**All reset**

1. Turn power OFF.
2. While pushing [CLR], push [POWER] for 1 sec. to turn power ON.
3. Rotate [DIAL] to select "YES" or "NO", then push [ENT].
   An all reset is performed when "YES" is selected; selecting "NO" cancels the operation.
10 OTHER FUNCTIONS

Data cloning

The IC-R10 has receiver-to-receiver data cloning capability. This function is useful when you want to copy all of the programmed contents from one IC-R10 to another.

An optional OPC-474 CLONING CABLE is required.

In addition, the optional CS-R10 CLONING SOFTWARE is available to clone and edit contents using a PC.

Set cloning mode and start cloning

1. Turn power OFF.
2. While pushing [V/M], push [POWER] for 1 sec. to enter cloning mode.
3. Connect an optional OPC-474 between both [SP] jacks.

- `C` (left brace)
- `>` (right brace)
CONTROL COMMANDS

General

The IC-R10 can be connected to a PC via the PC’s RS-232C port using an optional CT-17 CI-V LEVEL CONVERTOR. This allows you to control the receiver from the PC and/or transfer data from the receiver to the PC.

Control is provided via Icom’s CI-V Communication Interface.

Data format

The CI-V system can be operated using the following data formats. Data formats differ according to command numbers. A data area is added for some commands.
